# 1. INTRODUCTION

In accordance with California Environmental Quality Act (CEQA) guidelines, the Monterey Regional Water Pollution Control Agency (MRWPCA) is preparing a Draft Environmental Impact Report (EIR) for the Monterey Peninsula Groundwater Replenishment Project (GWR Project or proposed project). The Draft EIR will assess the potential impacts from the proposed project on the physical environment. On May 30, 2013, MRWPCA began the CEQA scoping process to help determine issues, mitigation measures and alternatives to be evaluated in the Draft EIR by issuing a Notice of Preparation (NOP), provided in Appendix A. The NOP described the proposed project and identified opportunities for agencies and the general public to submit comments on topics to be considered in the EIR. The MRWPCA also held an in-person scoping meeting on June 18, 2013; the meeting was advertised in local papers and notice also provided in the circulated NOP. In Section 6 of this report, a summary of the Supplement to the May 2013 NOP is provided and the relevant comments received during that second scoping period are summarized.

This report provides an overview of the scoping process for the GWR Project, and summarizes the comments received during the scoping period. Comments from this report that are applicable to a particular topic in the EIR are described in the introduction to that topical section of the Draft EIR.

This report is intended to summarize and document the comments received during the two scoping periods: May 30, 2013 to July 2, 2013 and December 9, 2014 through January 8, 2015, including both verbal and written comments. The MRWPCA will use this report as a tool to ensure that scoping comments are considered during preparation of the Draft EIR.

# 2. PURPOSE OF SCOPING PROCESS

CEQA Guidelines Section 15082 specifies that, after deciding that an environmental report is required for a project, the lead agency must send to the Office of Planning and Research and each responsible agency and trustee agency a notice of preparation stating that an environmental impact report will be prepared.

> *"The notice of preparation shall provide the responsible and trustee agencies and the Office of Planning and Research with sufficient information describing the project and the potential environmental effects to enable the responsible agencies to make a meaningful response."*

Within 30 days after receiving the notice of preparation, each responsible and trustee agency and the Office of Planning and Research must provide the lead agency with specific detail about the scope and content of the environmental information related to the responsible or trustee agency's area of responsibility that must be included in the EIR. At a minimum the response shall identify:

> *"The significant environmental issues and reasonable alternatives and mitigation measures that the responsible or trustee agency, or the Office of Planning and Research, will need to have explored in the draft EIR."*

In order to expedite consultation, the lead agency may request one or more meetings between representatives of the agencies involved to assist the lead agency in determining the scope and content of the environmental information that the responsible or trustee agency may require.

CEQA Guidelines Section 15083 recognizes that the lead agency may also consult with any person or organization it believes will be concerned with the environmental effects of the project.

> *"Prior to completing the draft EIR, the Lead Agency may also consult directly with any person or organization it believes will be concerned with the environmental effects of the project. Many public agencies have found that early consultation solves many potential problems that would arise in more serious forms later in the review process. This early consultation may be called scoping. Scoping will be necessary when preparing an EIR/EIS jointly with a federal agency.*
> *(a) Scoping has been helpful to agencies in identifying the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in an EIR and in eliminating from detailed study issues found not to be important.*
> *(b) Scoping has been found to be an effective way to bring together and resolve the concerns of affected federal, state, and local agencies, the proponent of the action, and other interested persons including those who might not be in accord with the action on environmental grounds.*
> *(c) Where scoping is used, it should be combined to the extent possible with consultation under Section 15082. "*

MRWPCA distributed the notice of preparation to responsible and trustee agencies, and to the Office of Planning and Research, and invited responsible and trustee agencies to a scoping meeting. In addition, MRWPCA distributed the NOP to interested members of the public and organizations, and opened the scoping meeting to the public.

The comments provided by the public and agencies during the scoping process will help the MRWPCA identify issues, methods of analyses, and level of detail of information and analysis in the EIR. The scoping comments will also assist the MRWPCA in developing a reasonable range of feasible alternatives that will be evaluated in the EIR.

Scoping comments that pertain to CEQA will be considered during the preparation of the Draft EIR. Non-CEQA comments will be noted for the record in the final version of this scoping report. The MRWPCA and the EIR preparers, which includes specialists in each of the environmental subject areas covered in the EIR, will assess the comments received and determine how they should addressed. This consideration of scoping comments is intended to ensure that the EIR is both comprehensive and responsive to issues raised by the public and regulatory agencies, and satisfies all CEQA requirements.

Scoping is not conducted to resolve differences concerning the merits of a project or to anticipate the ultimate decision on a proposal. Rather, the purpose of scoping is to help ensure that a comprehensive EIR will be prepared that provides an informative basis for the decision-making process.

# 3. Overview of Scoping Process

## 3.1 Mailing List

In preparation for the scoping period, the MRWPCA developed a contact list of potentially affected persons and agencies that would have an interest in, or jurisdiction over, project-related actions proposed within the project area. The contact list included all known federal, state, responsible, and trustee agencies involved in approving or funding the project, as well as relevant local agencies and special districts with jurisdiction in the project area. The list was developed using the Monterey Peninsula Integrated Regional Water Management (IRWM) stakeholder list, the MRWPCA noticing distribution list, Monterey Peninsula Water Management District noticing distribution list, and the Greater Monterey County IRWM Regional Water Management Group.

## 3.2 Notice of Preparation

A Notice of Preparation was prepared in compliance with the CEQA Guidelines Section 15082 (Appendix A). The NOP solicited comments on the scope of environmental issues as well as alternatives and mitigation measures that should be explored in the EIR. The NOP provides background information on relevant water supply conditions, briefly describes the proposed GWR Project, identifies the location of the project and describes the probable environmental issue effects of the project to be analyzed in the EIR. Public agencies were invited to comment on the scope and content of the environmental information that is relevant to each agency's statutory responsibilities with regard to the proposed GWR Project. Members of the public were also invited to provide their comments on the scope of the EIR. The public scoping period began on May 31, 2013 and ended at 5:00 PM on Tuesday, July 2, 2013, which provided the required 30-day scoping comment period. To initiate the required scoping period, 15 copies of the NOP with the required transmittal, were submitted via overnight mail to the Governor's Office of Planning and Research (OPR) State Clearinghouse. The OPR State Clearinghouse distributes the NOP to applicable state agencies and departments, including the State Water Resources Control Board, Division of Financial Assistance, a state agency division that will act as designated lead for federal environmental regulatory compliance (i.e., CEQA-plus) for the Clean Water State Revolving Fund Program, which is partially funded by the U.S. Environmental Protection Agency. In addition, the NOP was distributed electronically and by mail to over 638 government agencies, non-government organizations, private companies, and individuals (see Appendix B for an overview of NOP recipients).

## 3.3 Other Notifications

- Notice of Availability (NOA) of the NOP was published in the following newspapers:
    - Monterey Herald on June 2 and 9, 2013
    - Californian – Salinas on June 5 and 12, 2013
    - Coast Weekly, Carmel Pine Cone and Cedar Street Times (various dates June 2012)
- NOA was posted at the MRWPCA Office (5 Harris Ct, Monterey, CA 93940) and at the MRWPCA Wastewater Treatment Plant (14811 Del Monte Boulevard , Marina, CA 93933)
- NOP was posted on the MRWPCA GWR Project website

- NOP was sent to the following libraries for public posting:
    - Carmel Harrison Library
    - Carmel Valley Public Library
    - Castroville Public Library
    - California State University Monterey Bay Library
    - Marina Library
    - Monterey Library
    - Monterey Peninsula College Library
    - Pacific Grove Library
    - Salinas Public Library
    - Seaside Library

MRWPCA also made additional outreach efforts for the public scoping meeting through print and social media. A press release was sent to media outlets in the Monterey Bay region identifying the project, the NOP scoping period and the date and time for the public scoping meeting. An "evite" event invitation was also set up on social media for the NOP Public Scoping meeting with a link to the GWR website reaching approximately 150 people.

### 3.4 PUBLIC SCOPING MEETING

The MRWPCA held a public scoping meeting on Thursday, June 18, 2013 from 6:00 to 8:00 PM at the Oldemeyer Center: Dance Hall Room, 986 Hilby Avenue, Seaside, CA 93955. The scoping meeting included a presentation of the information contained in the NOP, an overview of the CEQA process, and provided attendees an opportunity to comment on the scope of the EIR (see presentation in Appendix C-1). A total of 37 people attended the scoping meeting including: government representatives, non-governmental organizations, and local citizens (see Appendix C-2). Comments received during the scoping meeting were documented during the meeting on flipcharts (see Appendix C-3), and also summarized in meeting notes (see Appendix C-4).

## 4. SUMMARY OF SCOPING COMMENTS

During the scoping period, MRWPCA received comments in the form of personal communication (from one individual), emails, and letters. Verbal comments were received at the scoping meeting held on June 18, 2013. This section contains a summary of all verbal and written comments received. The meeting notes from the scoping meeting are included in Appendix C-3 and C-4 and copies of written comments are included in Appendix D.

The MRWPCA consultant team and staff reviewed all of the scoping comments, numbered the individual comments within each letter, prepared a one- to two-sentence summary of each comment, and grouped the comments into the following issue, and sub-issue categories:

- General/Procedural Comments
- Comments on Project Description and Alternatives *[Note: A matrix of the type of comment, or sub-issue category, within this general category of comments is also provided.]*

- National Environmental Policy Act Process, including Federal Regulatory Compliance
- Permits/Authorizations/Agreements/Rights of Way
- Comments on Specific EIR Topical Issues
    - Agriculture and Forestry
    - Air Quality/Greenhouse Gas
    - Biological Resources
    - Climate Change Effects on Project
    - Cultural Resources
    - Hazards / Public Health and Safety related to Drinking Water Quality
    - Land Use/Consistency with Plans and Policies
    - Groundwater Hydrology
    - Growth Inducing Impacts
    - Hydrology and Water Quality: Surface Water
    - Traffic during Construction
    - Utilities
    - Water Demand/Supplies
    - Cumulative Impacts
- Issues Not Analyzed under CEQA
    - Economics /Cost, except as it may result in indirect physical impacts to the environment

The comment summaries seek to capture the main point of every comment in a way that will facilitate addressing the comment in the EIR and the CEQA process, more generally. The full version of comment letters are provided in Appendix D and this Appendix should be reviewed together with this scoping report. [Some individual comments apply to multiple topical areas, and will be considered in all pertinent topical areas of the EIR.]

## 4.1 List of Letters/Commenters and Acronyms

A. Eleanor Citen (EC)
B. Water Plus (WP)
C. State Water Resources Control Board (SWRCB)
D. U.S. Army Garrison, Presidio of Monterey, Directorate of Public Works, Master Planning (USA POM)
E. Department of Parks and Recreation (DPR)
F. Coalition of Peninsula Businesses (CPB)
G. Farm Bureau Monterey (FBM)
H. Monterey County Resource Management Agency (MCRMA)
I. California State Lands Commission, Division of Environmental Planning and Management (CSLC)
J. Monterey Regional Waste Management District (MRWMD)
K. Peter Le (PL)
L. California Department of Public Health, Drinking Water Program, Environmental Review Unit (CDPH)
M. Seaside Basin Watermaster (SBW)
N. Monterey Peninsula Water Management District (MPWMD)
O. City of Pacific Grove (CPG)
P. City of Seaside (CSe)
Q. City of Monterey (CM)
R. Marina Coast Water District (MCWD)
S. Fort Ord Community Advisory Group (FOCAG)
T. City of Salinas (CSa)
U. Bill Carrothers (BC)

<u>List of Commenters at the Public Scoping Meeting</u>

MTG-A. Bill Carrothers
MTG-B. Ron Weitzman (these comments were also submitted in written form "Letter B")
MTG-C. George Riley
MTG-D. Helen Rucker
MTG-E. Bill Carrothers (a second time)
MTG-F. Ron Weitzman (a second time)
MTG-G. Helen Rucker (a second time)

## 4.2 Comments on General CEQA and Procedural Issues

C-15: The Water Board staff requests that they receive the draft CEQA document and that they receive notice to all associated hearings and meetings. (SWRCB)

H-5: Monterey County Resource Management Agency requests a copy of the Administrative Draft EIR. (MCRMA)

I-1 California State Lands Commission (CSLC) is a trustee agency and if the GWR Project involves work on sovereign lands, the CSLC will act as a responsible agency. (CSLC)

I-14: Mitigation measures should be specific, feasible and enforceable obligations. (CSLC)

K-9: Requests that MRWPCA staff make a presentation to the MCWD Board on their expectations of the MCWD roles on this proposed project. (PL)

O-1: The City of Pacific Grove is in support of the goals to expand recycled water uses. (CPG)

O-2: Pacific Grove is developing its own recycled water project, the Pacific Grove Local Water Project, to provide non-potable water to multiple sources. (CPG)

T-3: City of Salinas believes funding for public outreach is currently inadequate for the scale of the project. Two large economic entities need to agree and approve the project in addition to multiple local jurisdictions, agencies and citizen groups, state and federal entities. It is highly visible and controversial making it especially important that good communication and agreement be attained. A broad array of media platforms need to be used to communicate the project honestly and transparently and to avoid past mistakes. It is imperative that the communications strategy be at the highest level of skill and effort. A rethinking of communications strategy is in order to guarantee success, as will a rethinking of funding. (CSa)

MTG A1-1: This project will need an outstanding hydrologist that is very familiar with the Seaside Basin, a superb water engineer, and a gifted leader.

MTG-C1: Will the EIR explore or include any of the positive impacts in addition to the negative impacts?

MTG-D1: Concerned about the outreach that was done for this meeting and the project in general; noted that few residents were in attendance.

MTG-D2: It is important that "non-experts" are included in the scoping and made aware of project issues.

## 4.3 Comments on Project Description and Alternatives

*NOTE: Table 1 at the end of this report contains a matrix that summarizes the applicability of the comment to the following issues: (1) overall project objectives, purpose and need, (2) alternatives consideration/analysis, (3) project description: mapping / background, (4) relationship to the California Public Utilities Commission's (CPUC's) EIR on the Monterey Peninsula Water Supply Project (MPWSP), and (5) the various project description elements/components, including source water, treatment product water conveyance, concentrate disposal, and injection/recharge.*

D-3: The EIR should explain environmental reasons for selecting and eliminating alternative technologies, or "barriers" for treatment of water. (USA POM)

F-1: The project description should be amended to establish a clearer project purpose and goal. The project's relationship and/or inter-relationship with the regional water project pending before the CPUC should be explained. Whether the GWR Project is intended to be a stand-alone project or as a supplement to Cal-Am's project should be explained. (CPB)

F-8: The EIR should study the GWR project as an independent source of additional Peninsula water supply. (CPB)

H-4: The EIR should include alternate locations of facilities to minimize environmental impacts in alternative analysis. (MCRMA)

I-3: The EIR should provide more detailed project maps and exact locations of injection wells. (CSLC)

I-4: The CSLC identify the project objectives and the project components as described in the NOP. (CSLC)

I-5: The project description should be as precise as possible; it should describe the details of all allowable activities and the timing and length of activities. (CSLC)

I-11: The EIR should consider the effects of sea level rise both on the project and the rate of saltwater intrusion. A project alternative should be provided that would be more resilient to sea level rise. (CSLC)

K-2: The EIR should explain why 3,500 AFY is the target amount of water produced. The EIR should show calculations on this based on this goal number for both existing and future conditions. (PL)

K-3: Will this project utilize the MCWD designs for modified regional treatment plant that were part of the RUWAP project and will this portion of the GWR project be paid by MCWD? What additional work on the regional treatment plant that will be done on this project? How does MRWPCA identify and separate all costs for two different projects? (PL)

K-4: What are the impacts of the GWR project on the MCWD recycled water project? What is the required separation between MRWPCA recycled pipes and MCWD recycled pipes? (PL)

K-5: The EIR should consider the alternative of recharging the Seaside Aquifer with excess inter flow water from the Salinas River. (PL)

K-6: How do the discharges of the proposed advanced water treatment plant and secondary source water affect the MCWD brine disposal capacity and the total capacity of the existing outfalls? (PL)

M-1: GWR project will not "replenish" the Seaside Groundwater Basin, as the NOP claims. It will act as an interim storage basin for the injected water until it is pumped out for municipal use. (SBW)

M-3: The map provided in the NOP does not clearly show were the facilities are to be located; provide detailed maps of recharge facilities. (SBW)

M-4: The NOP states that Cal Am owns 12 wells within the Seaside Groundwater Basin, this should be changed to, "Cal Am *currently operates* 12 production wells in the Seaside Groundwater Basin." (SBW)

M-5: The description of the Watermaster should be changed to, "The Watermaster Board of Directors consists of nine entities, one representative from each…" The next-to-last sentence on page seven should read, "Water levels were found to be below sea level in *portions of* both…" (i.e., add "portions of") (SBW)

M-6: The secondary goal of assisting in the prevention of seawater intrusion in the Seaside Groundwater Basin should be removed or clarified, per comment M- 1. (SBW)

M-7: Due to the known contamination in Blanco Drain and Reclamation Ditch waters, the GWR treatment facilities should be designed to address all potential pollutants to produce water of suitable quality for injection into the Seaside Groundwater Basin, which is used for potable water supply. (SBW)

M-8: The first sentence on page 17 should be revised to read, "With groundwater levels currently below sea level in *portions of* both ..." (SBW)

O-3: In order to comply with State Water Board requirements for discharges to Areas of Special Biological Significance, Pacific Grove may divert a portion of (approximately 2,500 gpm to 12,000 gpm) its storm water to the MRWPCA treatment plant for use in the GWR project. (CPG)

O-4: Address the facilities that would be required to convey additional storm water from Pacific Grove. (CPG)

O-5: The benefits to local MS4 discharges should be acknowledged in the Project Objectives. (CPG)

P-1: Could the project scope be expanded to also consider recharging the Carmel River as either an alternative or as an option? (CSe)

P-4: Project design is not finalized and the NOP contains language describing possible adverse constraints; change language to allow flexibility in the final project design to facilitate project implementation. (CSe)

P-5: Please clarify the areas and how much land in the City of Seaside are being referred to as the "Coastal Recharge Facilities" and the "Inland Recharge Facilities" as shown in Figure 2. (CSe)

P-6: Correct or clarify the NOP statement that the proposed inland recharge facilities are within a City-planned utility corridor; no City-planned utility corridor in the area shown in Figure 2. (CSe)

P-7: Please clarify where the four deep injection wells noted under the description of Inland Recharge Facilities on page 17 would be built, including well containment, back flush pit, fencing, treatment facility, etc. (CSe)

P-9: Clarify or remove page 17 statement regarding recharge ability of shallower wells in the Coastal Recharge Facilities. The statement describes the potential facilities but also appears to discount the value of the facilities when addressing recharge capability. (CSe)

P-10: Clarify statement on page 17 of NOP regarding available land within the City of Seaside. Suggest "The locations for the proposed coastal recharge facilities were determined based on an analysis of *potentially* available land and known aquifer characteristics." (i.e., add "potentially") (CSe)

Q-1: Concerns about the process and rationale behind the project definition. In order to ensure an adequate environmental review the definition and understanding of the project must be clear, for this the scope of the project might need revision. Lack of clarity behind the background of how the project scope was defined. If revision is necessary, now is a good time for it. (CM)

Q-2: Has MRWPCA considered sources water from the perspective of dry weather patterns or wet weather flows from storm drains? Identification of sources is not consistent in the NOP. (CM)

Q-5: Will there be any credits to member entities for flows that go into the GWR and if there are, will there be any quantification of what those credits will be? (CM)

R-2: Encourages MRWPCA to explore alternative source water volumes above the 3,500 AFY total specified in the NOP. (MCWD)

R-4: Requests inclusion of potential for use of Marina Coast Water District's recycled water facilities for conveyance of GWR water from AWT facility to Seaside Groundwater Basin, given appropriate compensation to the district for that access. (MCWD)

R-5: Recommends exploration of long-term plan for GWR Project. Will project continue injecting water into the Seaside Groundwater Basin once the Basin is recharged and operating within protective groundwater elevations and sustainable yield? Are there other uses for AWT water? Sending AWT water north to combat seawater intrusion in the Salinas Valley Groundwater Basin is a possibility. (MCWD)

R-6: MCWD encourages MRWPCA to evaluate alternatives that include variable seasonal flow rates of source waters without the need for including secondary or tertiary effluent sources. The seasonal flow of water sources for the AWT facility is an operational consideration if the outflow is to be at a single predictable rate. (MCWD)

T-4: Recommends clarification and emphasis on project's independent justification, purpose and utility. This is especially true for any desalination project, there is a lot of discussion of them as though they are connected. (CSa)

T-5: Regarding options A and B pipeline routing, between City of Salinas agricultural wash water settling ponds and the MRWCPA treatment facilities, please also address the pipeline from City of Salinas pump station to treatment facilities. (CSa)

T-7: Recommend clarification about whether source waters are from one specific source "…or a combination of the following sources…" and delineate how the determination will be made, and when. (CSa)

T-8: Recommend that MRWPCA remain flexible, if possible, with regard to detail of pipe size, capacity, pump location and size. That CEQA studies focus on routing and environmental factors rather than system design as that is not yet finalized. Also, if more than 3,500 AFY can be sourced, would environmental processing need to be repeated or is it possible to avoid going through the process again if system capacity were to increase? (CSa)

T-9: Regarding page 13, recommend that MRWPCA consider two conveyance pipelines be laid rather than one, for both source and recycled water. This would accomplish both cost savings and give MRWPCA a leg up as a regional source of recycled water. The second pipeline may remain temporarily unused, but could be put to use later for recycled water or for greater intake of source water and the economics of scale would be very beneficial in the long term. (CSa)

MTG-C2: Will other alternatives to the project (besides those already included) be addressed in the EIR?

MTG-F1: Is it possible that a larger scale version of the GWR project can solve the entire water supply issue, therefore eliminating the need for a desalination plant?

## 4.4 Comments on NEPA Process, including Federal Regulatory Compliance

C-3: The CWSRF Program is partially funded by the USEPA, and therefore, it requires CEQA-Plus environmental documentation and review for project. The Water Board will consult directly with responsible agencies. Any environmental issues raised by these agencies must be resolved prior to Water Board approval of CWSRF financing. The project must demonstrate compliance with following environmental regulations (SWRCB):

- Endangered Species Act Section 7 (also comment C-4) (SWRCB)
- National Historic Preservation Act Section 106 (also comment C-6) (SWRCB)
- Federal Clean Air Act conformity (also comment C-8) (SWRCB)
- California Coastal Zone Management Act (also comment C-9) (SWRCB)
- Clean Water Act Section 404 (also comment C-10) (SWRCB)
- Farmland Protection Policy Act (also comment C-11) (SWRCB)
- Migratory Bird Treaty Act (also comment C-12) (SWRCB)
- Flood Plain Management (also comment C-13) (SWRCB)
- Wild and Scenic Rivers Act (also comment C-14) (SWRCB)

T-1: Project may be eligible for federal funding. City of Salinas advises that CEQA could be used to develop NEPA if done correctly, and assist with federal funding. (CSa)

## 4.5 Comments on Permits/Authorizations/Agreements/Rights of Way

I-2: The CSLC has jurisdiction and management of Tidelands, submerged lands, and beds of navigable lakes and waterways. All tidelands and submerged lands, granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the Common Law Public Trust. (CSLC)

E-1: The Department is concerned about the installation of the product water pipeline within the TAMC ROW, and the access that would be taken through FODSP. This access must be coordinated in advance (up to 18 months for temporary construction easements). Department staff should be included in any meetings that involve the use of FODSP. (DPR)

F-2: If use of CSIP facilities are used as part of the project, the rights landowners for use of reclaimed water up to the first 19,500 AFY and MRWPCA's right to divert any portion of that water must be explained. (CPB)

F-3: Source waters must be clearly identified and the status of agreements for acquisition must be disclosed. Legal rights to the use the source water and then the distribution of recycled water need to be clearly established and legal disputes must be resolved, and if necessary, water supply must be sufficient to meet the assurances to the agricultural community and provide water for sale to Cal Am for drinking water. (CPB)

G-2: There must be a clear understanding of what water rights are used for the project. Orange County proved that technology and science support the benefits of this type of program. (FBM)

G-3: Monterey County Farm Bureau hopes the CEQA process will identify additional water sources that can be used to, and potential be contracted for, supplying reclaimed water for this program. (FBM)

H-1: This project will require Use Permits and Coastal Development Permits. Monterey County will be the responsible agency. (MCRMA)

H-6: Monterey County Resource Management Agency recommends that a Pre-Application meeting be scheduled as soon as possible. (MCRMA)

J-1: The Monterey Regional Waste Management District is responsible for approving the Electric Power Purchase Agreement as well as approving construction access and right of way easements. (MRWMD)

K-7: What is involved in the cooperation between MRWPCA and MCWD involve as described in page 11 of the NOP? (PL)

K-8: Has MRWPCA communicated with any staff from MCWD on its proposal to use partially completed recycled water systems? How does this project affect MCWD access to the acquired Armstrong Ranch property? (PL)

L-1: The CDPH is responsible for issuing water permits when there are changes to water supply. The CDHP will need to issue a new or amended water supply permit for the proposed project should the project proceed under the alternatives described. The CDHP will be a responsible agency under CEQA. (CDPH)

L-2: The project must comply with any draft of adopted (groundwater recharge and reuse) regulations. Frequent communication with CDPH is recommended. (CDPH)

M-10: The permit required from the Watermaster is called, "Agreement for Storage and Recovery of on-Native Water from the Seaside Groundwater Basin." (SBW)

P-2: The project proposes to use storm water as a potential water source. Does it propose to revise the MRWPCA NPDES Permit to allow storm water to be conveyed and treated by the existing sewer facilities? (CSe)

P-11: The EIR should include Seaside Highlands Homeowners Association in the "Potential Permits and Approvals Required" if some of the land being considered for Coastal Injection Wells is within their jurisdiction. (CSe)

Q-6: Existing and pending regulatory reasons mandate the flow of both dry and some wet weather storm drain flows to the MRWPCA STP, with the goal of removing pollutants from the receiving water (Monterey Bay). Have there been any discussions with the State Water Resources Control Board regarding the potential for discharging filter reject concentrate as described in the NOP into the receiving water that the diversions are intended to protect? (CM)

R-3: MCWD's senior right to return water from MRWPCA's treatment plant must be recognized when discussing available plant output. MCWD is willing to consider leasing a portion of those rights for a predetermined period. (MCWD)

T-2: The project should attain permits as soon as possible. The Water Board can take up to two years for issuance or revision of permits. Permitting should be done concurrently with environmental study processes. Recommend consulting with the Water Board early to clarify the process, and to explore the possibility of "Master Permits". (CSa)

## 4.6 Comments on Specific EIR Topical Issues

Agriculture and Forestry

C-11: The project must comply with the Farmland Protection Policy Act. (SWRCB)

H-3: If protected trees are to be removed, a Forest Management Plan is required. (MCRMA)

Air Quality/Greenhouse Gas

C-8: The project must be in compliance with Federal Clean Air Act by providing air quality studies. If the project is in a non-attainment area, it must also provide a summary of estimated emission for the project, and if the emission are above de minimis levels, but project is sized to meet the needs of the current population, show how this increase was calculated. (SWRCB)

I-10: The EIR should include a GHG emissions analysis that identifies thresholds, calculates emissions, determines significance, and identifies mitigation. (CSLC)

Biological Resources

C-3: The project must demonstrate compliance with following environmental regulations (SWRCB):

- Endangered Species Act Section 7 (also comment C-4) (SWRCB)
- California Coastal Zone Management Act (also comment C-9) (SWRCB)
- Clean Water Act Section 404 (also comment C-10) (SWRCB)
- Migratory Bird Treaty Act (also comment C-12) (SWRCB)

C-5: The Water Board will consult with USFWS and/or NMFS to determine of the project will have any direct or indirect effects on federally listed threatened, endangered, or candidate species on the site and surrounding areas. They will also identity measures to reduce such effects. (SWRCB)

E-2: The Department is concerned about construction equipment on park roads and trails, traffic control needs, and impacts to natural resources. (DPR)

I-6: The EIR should analyze all potentially significant effects on sensitive species and habitats and identify mitigation measures. CDFW CNDDB and USFWS Special Status Species databases should be used, and consultation with these agencies should occur and be documented. (CSLC)

I-7: The EIR should examine if any elements of the Project would favor non-native species. CDFW's Invasive Species Program can assist with this and help develop mitigation. (CSLC)

I-8: The EIR should evaluate noise and vibration impacts on fish and birds and include mitigation measures for these impacts. Consultation with CDFW, USFWS, and NOAA is recommended. (CSLC)

I-9: The EIR should evaluate impacts to biological resources associated with frac-out, and include mitigation measures. CSLC may request documentation of mitigation for frac-out prior to issuing a lease and provides an example of a Contingency and Resource Protection Plan. (CSLC)

Climate Change Effects on Project

I-11: The EIR should consider the effects of sea level rise both on the project and the rate of saltwater intrusion. A project alternative should be provided that would be more resilient to sea level rise. (CSLC)

Cultural Resources

C-3/C-6: The EIR should demonstrate compliance with the National Historic Preservation Act Section 106. (SWRCB)

C-7: The EIR must identify Area of Potential Effects; records search request must include an area larger than the APE. (SWRCB)

I-12: The EIR should evaluate impacts to submerged cultural resources; contact Pam Griggs (Senior Staff Counsel) to obtain shipwrecks data. Any submerged archaeological site of submerged historic resource that has remained in State waters for more than 50 years is significant. (CSLC)

I-13: Title to shipwrecks, archaeological sites and historic resources on or in the tide and submerged lands are vested in the State and under jurisdiction of the CSLC. (CSLC)

Hazards / Public Health and Safety related to Drinking Water Quality

A-1: Does not support the use of wastewater in the GWR Project because it contains many chemicals. She supported this statement with various materials from Aquafornia. She suggested that Mr. Holden attend meetings in Southern California in order to get excess water from their OC project. (EC)

B-1: The EIR should address toxins in each potential water source. Address discharge rate and natural capacity of Seaside aquifer and flow rate between injection and extraction wells. (WP)

D-1: The EIR should address the quality of recycled water after treatment, questions the effect of injecting recycled wastewater on Seaside Basin groundwater quality; EIR should be thorough and flawless leaving no unanswered questions about safe drinking water. (USA POM)

D-3: The EIR should explain the environmental reasons for selecting and eliminated alternative technologies, or “barriers” for treatment of water. (USA POM)

F-4: The EIR should include previously conducted studies showing contamination of the source waters. It should also explain how the contamination will be dealt with to meet California Department of Public Health standards. Examples of this should be provided. (CPB)

K-7: What is the current residence time of the recharged water as specified by the State? (PL)

M-7: Due to the known contamination in Blanco Drain and Reclamation Ditch waters, the GWR treatment facilities should be designed to address all potential pollutants to produce water of suitable quality for injection into the Seaside Groundwater Basin, which is used for potable water supply. (SBW)

R-7: The EIR should confirm with CDPH the required residence time between injection and extraction for all proposed water sources prior to the publication of the Draft EIR. (MCWD)

R-8: The EIR should confirm that the capacity of the Seaside Groundwater Basin is sufficient, within that predetermined residence time, for the injection of the GWR project water. (MCWD)

S-1: The EIR scope should include assessing existing hazards to drinking water, potential increasing hazards due to migration and leaching of toxic chemicals from former training ranges. (FOCAG)

S-2: Fort Ord is a National Superfund Site, with known contamination of area groundwater; consider the possibility of leaching and migration of chemicals into underground aquifers. Concern for whether the full extent of contamination, including constituents below thresholds, is known and whether these chemicals are a health hazard. Are the human health risks known for this level of exposure? What are the synergistic effects of munitions chemicals and pesticides on organisms? Are there studies available on the effects of low level exposure to these chemicals? (FOCAG)

S-3: The commenter expressed concerns for public communication, identification, record keeping, reporting, "out-gassing," and clean-up/remediation of chemicals and pesticides at very low levels in training areas, including Site #39 (including those in Tables 3, 4, 5, and 6 attachment to letter). (FOCAG)

S-4: Review of the cited cleanup documents did not support the Army's claim that presence of pesticides were evaluated and addressed by clean-up activities. There are several hundred chemicals potentially leaching out of ordnance into the ground as well as residual chemicals from weapons/ordnance training and pyrotechnics. Herbicides were widely used. (FOCAG)

S-5: The detection equipment used to clear this site is incapable of detecting nonmetallic, and deeply buried munitions. Munitions found onsite may not be reliably detected within 4 feet of the surface. (FOCAG)

S-6: a) What is the migration and fate of munitions and pesticide chemicals into this drinking water supply? b) Where did all the chemicals go? c) What Fort Ord document fully investigated the potential munitions and pesticide contamination? d) Is there ongoing monitoring and reporting of the potential munitions and pesticide contamination of the Seaside Groundwater Basin? Where is it? e) What might construction, development, and irrigating in the area above the Seaside Groundwater Basin do for migrating chemicals? (FOCAG)

Land Use/Consistency with Plans/Policies

H-1: The EIR should include an analysis of the project's consistency with the Monterey County General Plan, Land Use Plans, Title 20 and Title 21; this analysis should include appropriate maps. (MCRMA)

P-6: The NOP references a location for the proposed inland recharge facilities and states that it is a City planned utility corridor. This is not accurate as there is no City planned utility corridor in the area shown in Figure 2. Please clarify this point. (CSe)

R-1: MCWD encourages incorporation of GWR with the Greater Monterey County Integrated Regional Water Management Plan (IRWMP) and Monterey Peninsula IRWMP. (MCWD)

Groundwater Hydrology

(Note: Some of these comments are related to Hazards/Public Health, so are also included in that topical issue.)

B-1: The EIR should address discharge rate and natural capacity of Seaside aquifer and flow rate between injection and extraction wells. (WP)

K-7: What is the current State-required residence time of recharged water? (PL)

M-1: The GWR project will not "replenish" the Seaside Groundwater Basin, as the NOP claims. It will act as an interim storage basin for the injected water until it is pumped out for municipal use. (SBW)

N-1: Monitoring of the Santa Margarita aquifer shows that not all water injected would be expected to be extracted; this effect should be better understood. (MPWMD)

N-2: The EIR should contain an evaluation of both the travel time and volume of water moved between injection and extraction sites in order to determine what portion of injected water can be safely extracted and when. To minimize the potential of seawater intrusion a "buffer" amount of water could be injected before extraction occurs. (MPWMD)

R-7: The EIR should confirm with CDPH the required residence time between injection and extraction for all proposed water sources prior to the publication of the Draft EIR. (MCWD)

R-8: The EIR should provide information on whether the capacity of the Seaside Groundwater Basin is sufficient, within that predetermined residence time, for the injection of the GWR project water. (MCWD)

R-9: MCWD requests confirmation from CDPH of the horizontal distance required between points of injection and extraction in the event those two modes of operation are simultaneously occurring, prior to producing the Draft EIR. Will spacing and limited horizontal distance between recharge facility and Bay preclude the use of the facility for GWR? (MCWD)

Growth Inducing Impacts

F-7: The EIR should include a review of the growth-inducing impacts associated with this project. (CPB)

Hydrology and Water Quality: Surface Water

K-5: How do the discharges of the proposed advanced water treatment plant and secondary source water affect the MCWD brine disposal capacity and the total capacity of the existing outfalls? (PL)

Q-7: Existing and pending regulatory reasons mandate the flow of both dry and some wet weather storm drain flows to the MRWPCA STP, with the goal of removing pollutants from the receiving water (Monterey Bay). Have there been any discussions with the State Water Resources Control Board regarding the potential for discharging filter reject concentrate as described in the NOP into the receiving water that the diversions are intended to protect? (CM)

MTG-E3: The EIR should address the quality of water that would be sent to the outfall location as opposed to that of the water sent to Seaside for injection.

MTG-E1: The EIR should include information about industrial and environmental hygiene.

Traffic during Construction

E-2: The Department of Parks and Recreation is concerned about construction equipment on park roads and trails, traffic control needs and impacts to natural resources. (DPR)

H-2: Construction staging areas should be described in the project description and temporary construction impacts should be included in a traffic analysis. (MCRMA)

P-8: The EIR should provide information regarding traffic control and construction to coordinate with the City of Seaside on the implementation of the underground pipeline within the City. (CSe)

Utilities

P-3: Space is limited in the Product Water Conveyance Alignment (Option 2) right of way that follows Cal-Am's proposed pipeline alignment. It is a public right of way in the City of Seaside that would be significantly disruptive. MRWPCA and Cal-Am should coordinate installation to minimize impacts. (CSe)

Water Demand/Supplies

F-2: If use of CSIP facilities are used as part of the project, the rights of landowners for use of reclaimed water up to the first 19,500 AFY and MRWPCA's right to divert any portion of that water must be explained. (CPB)

F-5: The EIR should project the effect of water conservation measures on the amount of inflow and assess MRWPCA's ability to produce reclaimed wastewater. (CPB)

F-6: The EIR should address the effect of increased emphasis on water conservation, recycling and reduction in agricultural and urban runoff on the supply of source water. (CPB)

G-1: The agricultural community asserts that additional sources of water must be obtained in order to satisfy the desired amount of reclaimed water. Until this issue is settled they reserve their support for the project. (FBM)

K-1: The EIR needs to analyze if the project will have an effect on the amount of water supplied to the Marina Coast Water District. If MCWD utilizes it full 2.1 MGD recycled water, will this decrease the amount available for the project? Similarly, if 19,500 AFY is allotted to the agricultural community, how does this affect the proposed project? (PL)

M-2: The Watermaster would prefer that additional water be provided to replenish the Seaside Groundwater Basin to raise groundwater levels to protective elevations. The EIR should address the possible future expansion of the GWR project to provide this additional water. (SBW)

Q-3: Is the 3,500 AFY limitation a function of source water availability or system capacity? Why was a greater capacity not considered so that all member entities could contribute all non-storm/dry weather flows as well as some portion of storm water flows? (CM)

Q-4: How will the member entities ability to convey non-storm and storm water flows be apportioned? Will enlargements in the conveyance systems need to be made for equitable distribution of apportionment? (CM)

T-6: The scale of the project may be inadequate to process the 9,500 to 12,500 AFY of source water available. The remaining source water could be recycled and used for irrigation; however, the discussion of this opportunity has been limited with regard to its processing and distribution. The same applies to the tertiary treatment. Designing the facility for ease and rapidity of expansion is highly recommended. (CSa)

MTG-E2: The EIR should address the potential for operational failures at the Water Treatment Plant.

Cumulative

S-1: The EIR should consider proposed other ground disturbing activities including a horse park. (FOCAG)

P-3: Space is limited in the Product Water Conveyance Alignment Option 2 that follows Cal-Am's proposed pipeline alignment; that is a public right of way in the City of Seaside that would be significantly disruptive, MRWPCA, and Cal-Am should coordinate installation to minimize impacts. (CSe)

## 4.7 Issues Not Analyzed under CEQA

Economics /Cost

C-1: The State Water Board understands that the MRWPCA may be pursuing CWSRF financing for the GWR project, and states that they are a funding agency and an agency with jurisdiction by law. (SWRCB)

D-2: Mr. Guidi requests that the EIR analyze the cumulative socio-economic impacts of this project in conjunction with other regional water projects in the area. He asks that the economic ripple effects of rate be analyzed. An estimated cost (in AF/yr) should be provided and compared to other water supply projects. (USA POM)

K-3: Will this project utilize the MCWD designs for modified regional treatment plant that were part of the RUWAP project and will this portion of the GWR project be paid by MCWD? What additional work on the regional treatment plant that will be done on this project? How does MRWPCA identify and separate all costs for two different projects? (PL)

T-1: Varied and significant potential funding required for the project, including potential federal funding. City of Salinas Industrial Wastewater Improvement project is receiving some funding from federal Economic Development Grant, and possibly Community Development Block Grant as well. City of Salinas advises that CEQA could be used to develop NEPA, and assist with federal funding.

U-1: Provide costs associated with scaling up the proposal, and what it would cost to design the project to have the potential for future capacity increases, including (1) cost of storage facility for excess effluent , (2) cost of solar energy for a desal-only project, (3) amount of required diluent , (4) cost comparison with desal-only project. (BC)

MTG-G1: Is the cost of the GWR project greater or less than the cost of a typical desalination plant?

MTG-G2: Who will bear the cost of this project; will local residents with lower incomes be able to afford to live in this area?

# 5. Consideration of Issues Raised in Scoping Process

This Scoping Report documents the process and results of soliciting and receiving comments on the scope of the EIR from interested agencies and the public. The scoping process assists the lead agency in determining those issues that other agencies, jurisdictions, groups, and public consider to be important to address in the GWR Project EIR. Every issue that has been raised during the Scoping Process that falls within the scope of CEQA will be considered in preparation of the EIR and will be addressed to the extent possible.

# Table 1
# Matrix of Scoping Comments on Project Description and Alternatives

| | Overall Purpose, Need, Objectives | Alternatives Suggested | Project Description: Mapping / Background | Relation to CPUC MPWS Project | Project Description Component | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Source Water | Treatment | Disposal of Reverse Osmosis Concentrate | Product Water Conveyance | Injection/ Recharge |
| D-3: Explain environmental reasons for selecting and eliminated alternative technologies, or "barriers" for treatment of water. | | X | | | X | | | | |
| F-1: Amend project description to establish a clearer project purpose and goal. The project's relationship and/or inter-relationship with the regional water project pending before the PUC, should be explained. Whether the GWR Project is intended to be a stand-alone project or as a supplement to Cal-Am's project should be explained. | X | | | X | | | | | |
| F-8: Study the GWR project as an independent source of additional Peninsula water supply. | X | X | | | | | | | |
| H-4: Include alternate locations of facilities to minimize environmental impacts in alternative analysis. | | X | | | | | | | |
| I-3: Provide more detailed project maps and exact locations of injection wells. [injection] | | | | | | | | | X |
| I-4: The CSLC reiterates the project objectives and the project components as described in the NOP. | | | | | | | | | |
| I-5: Make project description should be as precise as possible; it should describe the details of all allowable activities and the timing and length of activities. | X | | | | | | | | |
| I-11: The EIR should consider the effects of sea level rise both on the project and the rate of saltwater intrusion. A project alternative should be provided that would be more resilient to sea level rise. | | X | | | | | | | |
| K-2: Explain why 3,500 AFY is the target amount of water produced. The EIR should show calculations on this based on this goal number for both existing and future conditions. | X | | | | | | | | |
| K-3: Will this project utilize the MCWD designs for modified regional treatment plant that were part of the RUWAP project and will this portion of the GWR project be paid by MCWD? What additional work on the regional treatment plant that will be done on this project? How does MRWPCA identify and separate all costs for two different projects? | | | | | | X | | | |
| K-4: What are the impacts of the GWR project on the MCWD recycled water project? What is the required separation between MRWPCA recycled pipes and MCWD recycled pipes? | | | | | X | | | X | |
| K-5: The EIR should consider the alternative of recharging the Seaside Aquifer with excess winter flow water from the Salinas River. | | X | | | X | | | | |
| K-6: How do the discharges of the proposed advanced water treatment plant and secondary source water affect the MCWD brine disposal capacity and the total capacity of the existing outfalls? | | | | | | | X | | |

## Table 1
## Matrix of Scoping Comments on Project Description and Alternatives

| | Overall Purpose, Need, Objectives | Alternatives Suggested | Project Description: Mapping / Background | Relation to CPUC MPWS Project | Project Description Component | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Source Water | Treatment | Disposal of Reverse Osmosis Concentrate | Product Water Conveyance | Injection/ Recharge |
| M-1: GWR project will not "replenish" the Seaside Groundwater Basin, as the NOP claims. It will act as an interim storage basin for the injected water until it is pumped out for municipal use. | X | | X | | | | | | X |
| M-3: The map provided in the NOP does not clearly show were the facilities are to be located; provide detailed maps of recharge facilities. | | | X | | | | | | |
| M-4: The NOP states that Cal Am owns 12 wells within the Seaside Groundwater Basin, this should be changed to, "Cal Am *currently operates* 12 production wells in the Seaside Groundwater Basin." | | | X | | | | | | |
| M-5: The description of the Watermaster should be changed to, "The Watermaster Board of Directors consists of nine entities, one representative from each…" The next-to-last sentence on page seven should read, "Water levels were found to be below sea level in *portions of* both…" (i.e., add "portions of") | | | X | | | | | | |
| M-6: The secondary goal of assisting in the prevention of seawater intrusion in the Seaside Groundwater Basin should be removed or clarified, per comment M- 1. | X | | | | | | | | |
| M-7: Due to the known contamination in Blanco Drain and Reclamation Ditch waters, the of the GWR treatment facilities should be designed to address all potential pollutants to produce water of suitable quality for injection into the Seaside Groundwater Basin, which is used for potable water supply. | | | | | X | X | | | |
| M-8: The first sentence on page 17 should he revised to read, "With groundwater levels currently below sea level in portions of both ..." | | | X | | | | | | |
| O-3: In order to comply with State Water Board requirements for discharges to Areas of Special Biological Significance, Pacific Grove may divert a portion of (approximately 2,500 gpm to 12,000 gpm) its storm water to the MRWPCA treatment plant for use in the GWR project. | | X | | | X | | | | |
| O-4: Address the facilities that would be required to convey additional storm water from Pacific Grove. | | X | X | | X | | | | |
| O-5: The benefits to local MS4 discharges should be acknowledged in the Project Objectives. | X | | | | | | | | |
| P-1: Could the project scope be expanded to also consider recharging the Carmel River as either an alternative or as an option? | | X | | | | | | X | X |
| P-4: Project design is not finalized and the NOP contains language describing possible adverse constraints; change language to allow flexibility in the final project design to facilitate project implementation. | | | X | | | | | | |
| P-5: Please clarify the areas and how much land in the City of Seaside are being referred to as the "Coastal Recharge Facilities" and the "Inland Recharge Facilities" as shown in Figure 2. | | | | | | | | | X |

## Table 1
## Matrix of Scoping Comments on Project Description and Alternatives

| | Overall Purpose, Need, Objectives | Alternatives Suggested | Project Description: Mapping / Background | Relation to CPUC MPWS Project | Project Description Component | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Source Water | Treatment | Disposal of Reverse Osmosis Concentrate | Product Water Conveyance | Injection/ Recharge |
| P-6: Correct or clarify the NOP statement that the proposed inland recharge facilities are within a City-planned utility corridor; no City-planned utility corridor in the area shown in Figure 2. | | | X | | | | | | X |
| P-7: Clarify where the four deep injection wells noted under the description of Inland Recharge Facilities on page 17 would be built, including well containment, back flush pit, fencing, treatment facility, etc. | | | | | | | | | X |
| P-9: Clarify or remove page 17 statement regarding Coastal Recharge Facilities since it describes potential facilities but appears to discount the value of the facilities for recharge. | | | | | | | | | X |
| P-10: Clarify statement on page 17 of NOP regarding available land within the City of Seaside. Suggest "The locations for the proposed coastal recharge facilities were determined based on an analysis of *potentially* available land and known aquifer characteristics." (i.e., add "potentially") | | | | | | | | | X |
| Q-1: Explain the process and rationale behind the project definition. In order to ensure an adequate environmental review the definition and understanding of the project must be clear, for this the scope of the project might need revision. Lack of clarity behind the background of how the project scope was defined. If revision is necessary, now is a good time for it. | | | X | | | | | | |
| Q-2: Has MRWPCA considered sources water from the perspective of dry weather patterns or wet weather flows from storm drains? Identification of sources is not consistent in the NOP. | | X | | | X | | | | |
| Q-5: Will there be any credits to member entities for flows that go into the GWR and if there are, will there be any quantification of what those credits will be? | | X | | | X | | | | |
| R-2: Explore alternative source water volumes above the 3,500 AFY total specified in the NOP. | X | X | | | X | | | | |
| R-4: Include potential for use of Marina Coast Water District's recycled water facilities for conveyance of GWR water from AWT facility to Seaside Groundwater Basin, given appropriate compensation to the district for that access. | | X | | | | | | X | |
| R-5: Recommends exploration of long-term plan for GWR Project. Will project continue injecting water into the Seaside Groundwater Basin once the Basin is recharged and operating within protective groundwater elevations and sustainable yield? Are there other uses for AWT water? Sending AWT water north to combat seawater intrusion in the Salinas Valley Groundwater Basin is a possibility. | X | X | | | | | | | |
| R-6: Encourages MRWPCA to evaluate alternatives that include variable seasonal flow rates of source waters without the need for including secondary or tertiary effluent sources. The seasonal flow of water sources for | | X | | | X | X | | | |

## Table 1
## Matrix of Scoping Comments on Project Description and Alternatives

| | Overall Purpose, Need, Objectives | Alternatives Suggested | Project Description: Mapping / Background | Relation to CPUC MPWS Project | Project Description Component | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Source Water | Treatment | Disposal of Reverse Osmosis Concentrate | Product Water Conveyance | Injection/ Recharge |
| the AWT facility is an operational consideration if the outflow is to be at a single predictable rate. | | | | | | | | | |
| T-4: Recommends clarification and emphasis on project's independent justification, purpose and utility. This is especially true for any desalination project, there is a lot of discussion of them as though they are connected. | X | | | X | | | | | |
| T-5: Regarding options A and B pipeline routing, address the pipeline from City of Salinas pump station to treatment facilities. | | X | | | | | | | |
| T-7: Clarify whether source waters are from one specific source "…or a combination of the following sources…" and delineate how the determination will be made, and when. | | X | | | X | | | | |
| T-8: MRWPCA should remain flexible, if possible, with regard to detail of pipe size, capacity, pump location and size. That CEQA studies focus on routing and environmental factors rather than system design as that is not yet finalized. Also, if more than 3,500 AFY can be sourced, would environmental processing need to be repeated or is it possible to avoid going through the process again if system capacity were to increase? | X | X | | | X | | | | |
| T-9: Regarding page 13, MRWPCA should consider two conveyance pipelines be laid rather than one, for both source and recycled water. This would accomplish both cost savings and give MRWPCA a leg up as a regional source of recycled water. The second pipeline may remain temporarily unused, but could be put to use later for recycled water or for greater intake of source water and the economics of scale would be very beneficial in the long term. | | X | | | X | | | | |
| MTG-C2: Will other alternatives to the project (besides those already included) be addressed in the EIR? | | X | | | | | | | |
| MTG-F1: Is it possible that a larger scale version of the GWR project can solve the entire water supply issue, therefore eliminating the need for a desalination plant? | X | X | | | | | | | |

# 6. SUPPLEMENT TO THE MAY 2013 NOTICE OF PREPARATION

As a result of ongoing engineering and technical evaluations and regional coordination efforts that occurred after the 2013 scoping process was completed, MRWPCA updated the project description and prepared a Supplement to the May 2013 NOP in December 2014. The purpose of the Supplement to the NOP was to provide public agencies, interested parties, and members of the public with an opportunity to comment on the scope of the EIR related to updates to the project description. The Supplement to the NOP was made available through the same distribution methods that were used for the May 2013 NOP. The public comment period on the Supplement to the NOP ran from December 10, 2014 to January 8, 2015. A copy of the Supplement to the NOP is included in this scoping report as Appendix E.

MRWPCA received 12 comment documents on the Supplement to the 2013 NOP. A list of the commenters, the date the comment document was received, and a summary of topics raised in the comment documents are included in Table 2. As with the comments that were received during the 2013 scoping process, topics that have been raised in the comment documents on the Supplement to the NOP that fall within the scope of CEQA will be considered in preparation of the EIR and will be addressed to the extent possible.

# NOTICE OF PREPARATION

## Monterey Peninsula Groundwater Replenishment Project Environmental Impact Report

## Introduction

In accordance with the provisions of the California Environmental Quality Act, the Monterey Regional Water Pollution Control Agency (MRWPCA), as California Environmental Quality Act lead agency, is preparing an Environmental Impact Report (EIR) for the proposed Monterey Peninsula Groundwater Replenishment Project (GWR Project). The GWR Project would create a reliable source of water supply by taking highly-treated water from a new advanced water treatment plant, and recharging the Seaside Groundwater Basin (or Seaside Basin) with the treated water using a series of shallow and deep injection wells. Once injected into the Seaside Basin, the treated water would mix with the groundwater present in the aquifers and be stored for future use. The primary purpose of the GWR Project is to provide 3,500 acre-feet per year (AFY) of high quality replacement water to California American Water Company (or Cal-Am) for delivery to its customers in the Monterey District service area; thereby enabling Cal-Am to reduce its diversions from the Carmel River system by this same amount.[1] Cal-Am is under a state order to secure replacement water supplies by December 2016.

This document serves as the Notice of Preparation (NOP) for the EIR for the GWR Project and solicits comments on the scope of environmental issues as well as alternatives and mitigation measures that should be explored in the EIR. Public agencies are invited to comment on the scope and content of the environmental information that is relevant to each agency's statutory responsibilities with regard to the proposed GWR Project. Members of the public also are invited to provide their comments on the scope of the EIR. **The 30-day public scoping period begins on May 31, 2013 and closes at 5:00 PM on Tuesday, July 2, 2013. A public scoping meeting will be held on Tuesday, June 18, 2013 from 6:00 to 8:00 PM at the Oldemeyer Center, Dance Room (986 Hilby Avenue, Seaside, CA 93955).** This NOP provides background information on relevant water supply conditions, briefly describes the proposed GWR Project, and identifies the environmental issue areas that will be analyzed in the EIR.

[1] Cal-Am is an investor-owned public utility that serves approximately 38,500 customers in the Monterey Peninsula area. Cal-Am's Monterey District service area is shown in Figure 1.

## Project Location

The GWR Project would be located within northern Monterey County and would include facilities located within the unincorporated areas of the Salinas Valley and the cities of Marina and Seaside as shown in **Figures 1** and **2**. The GWR Project would replenish the Seaside Basin, and would provide a portion of the replacement water supplies needed for Cal-Am's Monterey District service area.

## Project Background

MRWPCA was established in 1979 under a Joint Powers Authority agreement between the City of Monterey, the City of Pacific Grove and the Seaside County Sanitation District. MRWPCA operates the regional wastewater treatment plant, including a water recycling facility (collectively known as the Regional Treatment Plant), a non-potable water distribution system known as the Castroville Seawater Intrusion Project, sewage collection pipelines, and 25 wastewater pump stations. MRWPCA member communities include Pacific Grove, Monterey, Del Rey Oaks, Seaside, Sand City, Fort Ord, Marina, Castroville, Moss Landing, Boronda, Salinas, and other unincorporated areas in northern Monterey County. See **Figure 1**.

MRWPCA's Regional Treatment Plant is located two miles north of the City of Marina, on the south side of the Salinas River, and has a permitted capacity to treat 29.6 million gallons per day (mgd) of wastewater effluent.[2] At the Regional Treatment Plant, water is treated to two different standards: 1) Title 22 California Code of Regulations standards (tertiary filtration and disinfection) for unrestricted agricultural irrigation use, and 2) secondary treatment for discharge through the ocean outfall. Influent flow that has been treated to a tertiary level is distributed to nearly 12,000 acres of farmland in the northern Salinas Valley for irrigation use (the Castroville Seawater Intrusion Project). The Regional Treatment Plant primarily treats municipal wastewater, but also accepts some dry weather urban runoff and other discrete wastewater flows.

[2] The Regional Treatment Plant currently treats approximately 19 million gallons per day of municipal wastewater from a total population of about 250,000 in the northern Monterey County area shown generally in Figure 1.

### *Seaside Groundwater Basin*

The Seaside Basin underlies an approximately 19-square-mile area at the northwest corner of the Salinas Valley, adjacent to Monterey Bay (see Figure 1). The hydrogeology of the Seaside Basin has been the subject of numerous studies beginning with a California Department of Water Resources study in 1974. Monitoring data gathered since 1987 shows that water levels have been trending downward in many areas of the basin. A steep decline since 1995 in the northern coastal portion of the basin, where most of the groundwater production occurs, has coincided with increased extraction in that area after the State Water Resources Control Board required Cal-Am to reduce its Carmel River diversions, and instead maximize its pumping in the Seaside Basin.[3]

Groundwater is currently extracted from approximately 37 wells by 20 well owners in the Seaside Basin. Cal-Am owns 12 wells and pumps approximately 80% of the water produced in the basin. In addition, Cal-Am and Monterey Peninsula Water Management District operate a Seaside Basin Aquifer Storage and Recovery system that stores excess Carmel River water supplies during the wet season in the groundwater basin and recovers the banked water during the following dry season for consumptive use. The estimated average yield of the existing Aquifer Storage and Recovery facilities is 1,920 AFY, but varies yearly based on rainfall due to the requirement to maintain adequate Carmel River instream flows.

Historical and persistent low groundwater elevations caused by pumping have led to concerns that seawater intrusion may threaten the Basin's groundwater resources. In 2006, an adjudication process (Cal-Am v. City of Seaside et al., Case No. M66343) led to the issuance of a court decision that created the Seaside Basin Watermaster (Watermaster). The Watermaster consists of nine representatives, one representative from each: Cal-Am, City of Seaside, Sand City, City of Monterey, City of Del Rey Oaks, Monterey Peninsula Water Management District and Monterey County Water Resources Agency, and two representatives from landowner groups. The Watermaster has evaluated water levels in the basin and has determined that while seawater intrusion does not appear to be occurring at present, current water levels are lower than those required to protect against seawater intrusion. Water levels were found to be below sea level in both the Paso Robles (the shallower aquifer) and the Santa Margarita aquifers of the Seaside Basin in 2012; therefore, it is recognized that recharge into both aquifers would be beneficial for protection against seawater intrusion.

### *State Orders to Reduce Carmel River Diversions*

The 255-square-mile Carmel River Basin is bounded by the Santa Lucia Mountains to the south and the Sierra del Salinas to the north. The Carmel Valley aquifer, which underlies the alluvial portion of the Carmel River downstream of San Clemente Dam, is about six square-miles and is approximately 16 miles long. In the summer and fall, the alluvial aquifer is drawn down by private pumpers that extract approximately 2,200 to 2,400 AFY, and Cal-Am that pumps approximately 7,880 AFY.[4] Historically, this combined pumping has resulted in dewatering of the lower six miles of the river for several months in most years and up to nine miles in dry and critically dry years. Recharge of the aquifer is derived mainly

---

[3] See discussion of SWRCB Order No. 95-10 in the following section.

[4] This pumping quantity is based on the mean water production from the Carmel Valley Alluvial Aquifer between Water Year 2010 and Water Year 2012.

from river infiltration which comprises 85% of the net recharge.[5] The aquifer is replenished relatively quickly each year during the rainy season, except during prolonged periods of extreme drought.

In 1995, the State Water Resources Control Board issued Order No. WR 95-10, which found that Cal-Am was diverting more water from the Carmel River Basin than it was legally entitled to divert. The State Board ordered Cal-Am, instead, to maximize diversions (to the extent feasible) from the Seaside Basin. In addition, a subsequent Cease and Desist Order (SWRCB 2009-0060) issued in 2009 requires Cal-Am to secure replacement water supplies for its Monterey District service area by December 2016 and reduce its Carmel River diversions to 3,376 AFY by the 2016-17 timeframe. Cal-Am estimates that it needs 9,752 AFY[6] of replacement water supplies to reduce its Carmel River diversions to the degree required by the Cease and Desist Order and to reduce its pumping in the Seaside Basin in accordance with the Watermaster's pumping mandates.

Cal-Am, working with local agencies, has proposed construction and operation of a Cal-Am owned and operated desalination project (known as the Monterey Peninsula Water Supply Project)[7] either to provide all of the replacement water needed to comply with the Cease and Desist Order and the Seaside Basin Adjudication, or part of the replacement water if the GWR Project would be capable of producing the rest of the replacement water in a timely manner and at a reasonable cost. The California Public Utilities Commission, as the California Environmental Quality Act lead agency for the Monterey Peninsula Water Supply Project, published a Notice of Preparation of an EIR in October 2012 and intends to circulate a Draft EIR in July 2013.

### *GWR Project Relationship to the Monterey Peninsula Water Supply Project*

The GWR Project is designed to provide part of the replacement water needed for Cal-Am to comply with the Cease and Desist Order and the Seaside Basin Adjudication. The GWR Project could not produce all of the needed replacement water, but the primary goal of the project is to produce 3,500 AFY to be used by Cal-Am in order to reduce its Carmel River diversions by that same amount. The GWR Project could provide this quantity of replacement water regardless of whether the California Public Utilities Commission approves Cal-Am's application to construct and operate a desalination plant. In other words, the GWR Project could accomplish its objective, and be useful to reducing Carmel River diversions, independent from approval of Cal-Am's proposed desalination plant. While the GWR Project could proceed as an independent project, the GWR Project is related to the Monterey Peninsula Water Supply Project in that the GWR Project could reduce the size of Cal-Am's proposed desalination plant. Further, MRWPCA would not construct the GWR Project unless the California Public Utilities Commission

[6] Supplemental Testimony of Richard C. Svindland, January 11, 2013, Attachment 1, Application A.12-04-019 (*Application of CAW for Approval of the Monterey Peninsula Water Supply Project and Authorization to Recover All Present and Future Costs in Rates*)"

[7] In April 2012, California American Water submitted Application A.12-04-019 (*Application of CAW for Approval of the Monterey Peninsula Water Supply Project and Authorization to Recover All Present and Future Costs in Rates*) to the California Public Utilities Commission that is intended to secure replacement water supplies for the Monterey District associated with the regulatory orders and legal decisions described in this section. The MPWSP includes many of the same elements previously analyzed in the Coastal Water Project EIR (CPUC/ESA, 2009); however, key components, including the seawater intake system and desalination plant, have been relocated and/or modified under the current proposal and the current proposal is for private (Cal-Am) ownership of the intake system, desalination facility and conveyance pipeline.

approves a Water Purchase Agreement that authorizes Cal-Am to purchase the water that is produced by the GWR Project.

On April 20, 2012, the Monterey Peninsula Water Management District, MRWPCA, and Cal-Am entered into a Groundwater Replenishment Project Planning Term Sheet and Memorandum of Understanding to Negotiate in Good Faith to, among other things, enable planning and environmental evaluation of a GWR project by the following:

- to commit themselves to evaluate the ways in which a groundwater replenishment project could be effectively accomplished;
- to commit themselves to negotiate in good faith to reach agreement on such a project, should it be deemed viable;
- for MRWPCA to commit to act as lead agency to achieve California Environmental Quality Act compliance for such a project, should it be deemed viable;
- for Monterey Peninsula Water Management District to assist MRWPCA in providing the necessary financial support for planning and California Environmental Quality Act compliance; and
- to identify non-binding preliminary terms of a GWR Project agreement.

In its application to the California Public Utilities Commission for approval of the Monterey Peninsula Water Supply Project, Cal-Am proposed a three-pronged approach to replace most of its Carmel River diversions, as required by the Cease and Desist Order. The three prongs consist of: (1) desalination, (2) groundwater replenishment, and (3) aquifer storage and recovery. Cal-Am's application described the groundwater replenishment "prong" as follows and identified it as water supply that would reduce the capacity of the desalination component by 3,500 AFY:

> *"California American Water has entered into a Memorandum of Understanding with the MRWPCA and MPWMD to collaborate on developing the Groundwater Replenishment Project, included as Appendix A. If the Groundwater Replenishment Project has reached certain milestones by the time California American Water begins construction of the desalination plant (currently estimated to be near the end of 2014) and the cost of the water from it is reasonable, California American Water will be able to reduce the size of its proposed desalination plant. California American Water proposes to do this by filing a Tier 2 advice letter."*

# Project Objectives

The primary objective of the GWR Project is to replenish the Seaside Basin to produce 3,500 acre-feet per year (AFY) of high quality water that would replace a portion of Cal-Am's water supply as required by state orders. To accomplish this primary objective, the GWR Project would need to meet the following objectives:

- Be capable of commencing operation, or of being substantially complete, by the end of 2016 or, if after 2016, no later than necessary to meet Cal-Am's replacement water needs;
- Be cost-effective such that the project would be capable of supplying reasonably-priced water; and

- Be capable of complying with applicable water quality regulations intended to protect public health.

Secondary objectives of the GWR Project include the following:

- Assist in preventing seawater intrusion in the Seaside Basin;
- Assist in diversifying Monterey County's water supply portfolio;
- Provide additional water to the Regional Treatment Plant that could be used for crop irrigation through the Salinas Valley Reclamation Project and Castroville Seawater Intrusion Project system.

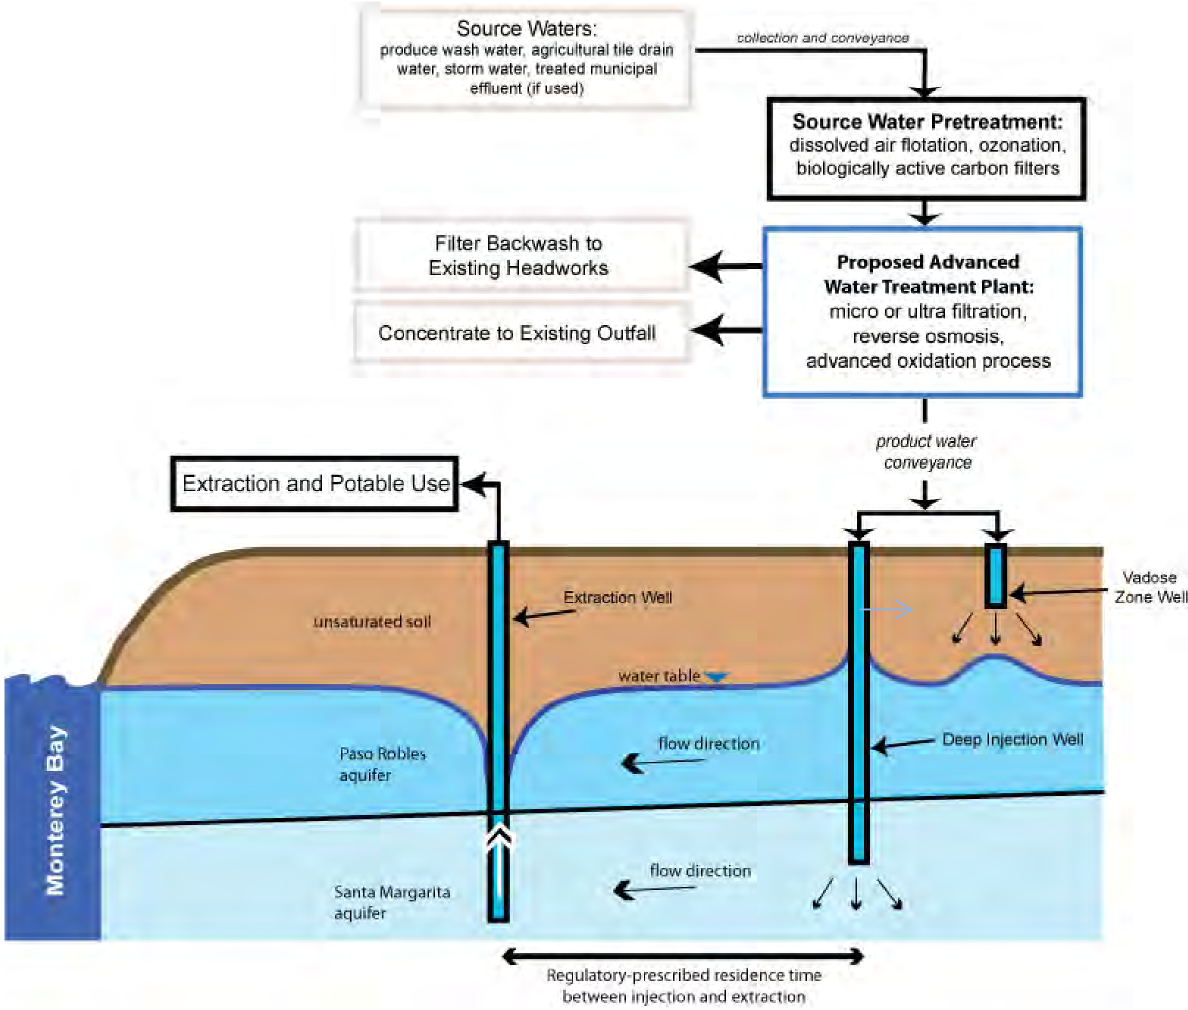
# Proposed Project

MRWPCA's GWR Project proposes to produce and deliver high quality treated water for replenishment of the Seaside Basin with the goal of enabling Cal-Am to reduce diversions from the Carmel River and its alluvial aquifer in compliance with the State Water Resources Control Board's Cease and Desist Order and to comply with the Seaside Basin Adjudication. The location of the GWR Project is shown in **Figure 1**. The GWR Project would include the following new facilities as shown in **Figure 2** and described in the following sections:

- *Source Water Conveyance Facilities*: diversion and collection facilities, including pipelines and pump stations to convey source water to the new treatment facilities,
- *Treatment Facilities:* pretreatment facilities, a new Advanced Water Treatment Plant, and associated facilities at the existing Regional Treatment Plant site to filter and treat the source water,
- *Product Water Conveyance Facilities:* pipelines, pump stations, and appurtenant facilities along one of two optional alignments to convey the treated water to the Seaside Basin, and
- *Replenishment/Recharge Facilities:* pipelines, deep injection and shallow (vadose zone) wells, and backflush facilities to be located at one or both of two optional locations (coastal and/or inland recharge sites) within the Seaside Basin boundaries.

A process diagram illustrating the operation of the GWR Project is provided in **Figure 3**. MRWPCA would construct, own, and operate the GWR Project facilities from source water collection and conveyance through injection into the Seaside Basin. After the recharged water resides within the subsurface soils and aquifer for the prescribed amount of time, the water would be extracted by others at existing municipal water supply wells.

**Figure 3. Overall GWR Project Process Schematic**



MRWPCA is coordinating with Cal-Am, Monterey Peninsula Water Management District, the Seaside Basin Watermaster, the City of Seaside, the City of Salinas, the Marina Coast Water District, Monterey County Water Resources Agency, and other public agency stakeholders regarding the GWR Project. The GWR Project would be designed and implemented in compliance with applicable regulatory requirements to protect public health. In particular, it is anticipated that the California Department of Public Health may require specific residence times for recharged water within the aquifer prior to extraction, which would be verified using tracer tests, if required, and groundwater monitoring.

### *Source Water Conveyance Facilities*

The GWR Project would use a combination of the following source waters as influent to the GWR Treatment Facilities:

- City of Salinas (City) Treatment Plant water,
- Blanco Drain water,
- Storm water collection systems of the City of Salinas and other MRWPCA member entities,
- Secondary or tertiary effluent from the Regional Treatment Plant, and
- Reclamation Ditch water.

A combination of these sources may be needed to meet the GWR Project objectives. The characteristics and availability of these water sources vary seasonally. Therefore, the GWR Project would be designed to accommodate a variety of flows, water quality characteristics, and delivery schedules. The following describes the potential source water types and facilities:

*City of Salinas (City) Treatment Plant water.* The City collects, transports, and treats water predominantly from food processing facilities within the City. Most of this water originates from the washing of produce for packaging (such as bagged lettuce). The water passes through existing pipelines to the City Treatment Plant located on the northwest side of Davis Road adjacent to the Salinas River. The water is aerated and sent to ponds and drying beds where it percolates into the shallow groundwater aquifer or evaporates.

If used as source water for the GWR Project, this water source would be collected at the City Treatment Plant and conveyed using new pipelines and pump stations to the MRWPCA's new GWR Project treatment facilities at the existing Regional Treatment Plant. One new pump station would be located at the City Treatment Plant. The maximum capacity of the pump station would be 10 mgd to allow for maintenance and operational flexibility. The conveyance would be through a new 27-inch diameter pipeline constructed along one of the following two potential routes between the City Treatment Plant and the proposed new Blanco Drain pump station (described below and shown on Figure 2):

- *City Treatment Plant Conveyance Option A.* Approximately 30,000 feet of new pipeline that would follow the farm roads north of and parallel to the Salinas River outside of the riparian vegetation area to the proposed new Blanco Drain pump station, or

- *City Treatment Plant Conveyance Option B.* Approximately 33,000 feet long of new pipeline that would follow paved roads (Blanco Road, Cooper Road, and Nashua Road), and some unpaved farm roads to the new proposed Blanco Drain pump station.

*Blanco Drain water.* The Blanco Drain is an existing system of dirt ditches and short pieces of pipe that collects and conveys agricultural tile drain water[8] and some storm water from about 6,000 acres of land to the Salinas River. The drainage area extends approximately from Highway 1 to Highway 68 along the Salinas River as it crosses Cooper, Blanco, Hitchcock, and Davis Roads. The water flows to an existing pump station owned and operated by Monterey County Water Resources Agency about 4,100 feet northwest of the intersection of Nashua and Cooper Roads. At this point, the water is pumped approximately 600 feet and then discharged to the Salinas River approximately 1,100 feet southeast and

[8] Tile drainage is an agriculture practice that removes excess water from soil subsurface.

upstream of the existing Salinas River Diversion Facility. The Salinas River Diversion Facility is a seasonal diversion structure operated by the Monterey County Water Resources Agency for the purpose of augmenting the irrigation water supplies for the Castroville Seawater Intrusion Project agricultural land areas (see Figure 1 for the location of the Castroville Seawater Intrusion Project and see Figure 2 for the existing agricultural irrigation supply pipelines).

If Blanco Drain water or City Treatment Plant water is used by the GWR Project as source water, then a new Blanco Drain pump station (see Figure 2) would be built near the site of the existing Monterey County Water Resource Agency pump station. A new 9,000-foot long, 30-inch diameter pipeline would transport water from the proposed new Blanco Drain pump station to the new GWR Project treatment facilities at the Regional Treatment Plant. Directional drilling would be used to cross under the Salinas River, and then the pipeline would be placed along the boundary of the Monterey Regional Waste Management District property to the MRWPCA's existing Regional Treatment Plant site.

*Storm water from the City of Salinas and other MRWPCA member entities.* Storm water from Salinas and other member entities may also be used for source water for the GWR Project. Storm water from the southwestern portions of the City of Salinas currently travels through existing pipelines to an existing City storm water pump station at the site of MRWPCA's existing Salinas Pump Station (see Figure 2, "Existing Salinas Pump Stations"). The water is then conveyed through an existing 66-inch diameter pipeline to an outfall structure on the Salinas River approximately 1,800 feet southeast of Davis Road (see Figure 2, "Existing Storm Water Outfall").

If this storm water is used as source water for the GWR Project (to augment treated wastewater), then dry weather and low flows of storm water would be conveyed by a new short, on-site pipeline from the City's Salinas storm water pump station to the MRWPCA's Salinas Pump Station and from there to the existing Regional Treatment Plant site. Alternatively, dry weather and low flows of storm water from the Salinas storm water pump station could be used directly for the new GWR Project through existing conveyance systems to the City Treatment Plant near Davis Road adjacent to the Salinas River. Storm water conveyance may occur using either: (1) the City's existing 33-inch diameter pipeline, or (2) when completed, the City's future proposed 42-inch diameter pipeline, both of which would provide a connection from the Salinas Pump Station site to the City Treatment Plant.

To capture and use storm water from the southwestern portions of Salinas during storm events (i.e., high flows), a new extension of the City's existing 66-inch diameter pipeline would be required to convey the storm water to the City Treatment Plant. A new, approximately 2,700-foot long, 66-inch diameter pipeline would be placed along unpaved farm roads adjacent to the Salinas River to convey water between the storm water outfall and the City Treatment Plant (see Figure 2). A new pump station, pipelines and appurtenant facilities at or near the City Treatment Plant would allow the GWR Project to conjunctively operate with the City Treatment Plant process in managing the flow of water through the ponds systems and, ultimately, to the new GWR Project treatment facilities using one of the City Treatment Plant conveyance pipelines (see Options "A" or "B" as shown on Figure 2 and described above under *"City of Salinas (City) Treatment Plant water"*).

Other MRWPCA member entities could also send storm water to the Regional Treatment Plant for use by the GWR Project by adding storm water into existing pipelines, manholes, or pump stations within the MRWPCA wastewater collection system.

*Secondary or tertiary effluent from the Regional Treatment Plant.* At the existing Regional Treatment Plant, water is treated to two different standards: 1) tertiary treatment for unrestricted agricultural irrigation use, and 2) secondary treatment for discharge through the ocean outfall. If water treated to secondary standards were used as source water for the GWR Project, then effluent would be withdrawn from the existing 60-inch diameter secondary effluent pipe at the Regional Treatment Plant. A new pump station at the Regional Treatment Plant would pump secondary treated water to the new GWR Project treatment facilities through a new 18-inch diameter pipeline approximately 1,900 feet long. If water treated to tertiary standards were used as source water for the GWR Project, then effluent would be withdrawn from an existing filtered effluent pipeline located at the Regional Treatment Plant (between the Filter Building and the Chlorine Contact Basins). A new pump station would be located adjacent to the Filter Building and would pump tertiary treated water to the new GWR Project treatment facilities through a new 18-inch diameter pipeline approximately 600 feet long.

*Reclamation Ditch water.* The Reclamation Ditch is operated by the Monterey County Water Resources Agency, and a portion of this ditch is shown on Figure 2 just north of Highway 183. The watershed of the Reclamation Ditch includes 157 square miles mostly within Monterey County. The watershed drains the northwestern slopes of the Gabilan Range as well as much of the City of Salinas and its surrounding lands. The Reclamation Ditch system is a network of excavated earthen channels used to drain surface runoff generated in the watershed. Urban runoff from the City of Salinas also drains into various channels of the Reclamation Ditch system via numerous storm water outfalls. The system drains into Tembladero Slough, then the Old Salinas River Channel, and ultimately into Moss Landing Harbor through the Potrero Tide Gates. The Reclamation Ditch system conveys and collects storm water and provides flood control during the winter, but consists mostly of agricultural tile drain water from the land north and west of the City of Salinas during the summer months.

If this source water is used by the GWR Project, the Reclamation Ditch water would be collected about 500 feet northwest of the intersection of Davis and W. Market/Highway 183 Roads. The water would enter a new pump station (see "Reclamation Ditch Pump Station" on Figure 2) constructed at that same location, and then would be pumped to an existing sewer pipeline that flows to MRWPCA's existing Salinas Pump Station. From that point, the Reclamation Ditch water would be comingled with sewage, pumped, and conveyed through an existing pipeline to the Regional Treatment Plant.

### Treatment Facilities

The new proposed Advanced Water Treatment Plant would produce water suitable for subsurface application in the Seaside Basin. Because one or more potential source waters would contain municipal wastewater, the GWR Project proposes to meet the regulations of the California Department of Public Health for indirect potable reuse. The Department of Public Health has prepared Draft Groundwater Recharge Regulations (March 2013) that require full advanced water treatment for projects that intend to recharge groundwater through injection wells directly into aquifers, including requiring reverse osmosis membranes used in advanced treatment to have 99% sodium chloride removal. The regulations also limit the concentration of total organic carbon and total nitrogen values. Specified treatment levels for pathogen reduction and treatment of chemicals of emerging concern would be required to satisfy Department of Public Health permitting requirements. The GWR Project would be designed to comply with the Draft Groundwater Recharge Regulations if final regulations have not been adopted by the time of its construction. Once final regulations are adopted, the GWR Project would comply with the final, adopted regulations. This will ensure that the GWR Project meets or exceeds all standards adopted to protect public health.

The GWR Project would include pretreatment of source waters, as needed, including pre-screening, ozone treatment, biological active carbon filtration, and dissolved air flotation. The Advanced Water Treatment Plant would include microfiltration or ultrafiltration, reverse osmosis, and advanced oxidation/disinfection using ultraviolet light with hydrogen peroxide. Post treatment and conditioning would most likely consist of decarbonation and possible introduction of pH adjusting and/or softening chemicals. Reverse osmosis concentrate would flow through a new concentrate pipeline and receiving station (allowing for mixing, sampling for water quality and flow rate) both proposed to be located within the Regional Treatment Plant site.

After mixing and sampling, the concentrate would be discharged into the on-site portion of the existing Regional Treatment Plant ocean outfall system.[9] Filter backwash waste would be routed to the Regional Treatment Plant headworks for secondary treatment, and if demand exists, tertiary treatment and use in the Castroville Seawater Intrusion Project system for agricultural irrigation.

### *Product Water Conveyance Facilities*

MRWPCA proposes to construct a pipeline, measuring up to 36 inches in diameter, to convey the advanced treated (or "product") water from the Advanced Water Treatment Plant to the Seaside Basin for injection, along one of two potential alignments as shown in **Figure 2**.

- Product Water Conveyance Option 1 would follow a portion of the recycled water pipeline alignment of the previously approved, and partially-constructed, Regional Urban Water Augmentation Program Recycled Water Project. The pipeline would be located primarily along paved roadway rights-of-way within urban areas. The Recycled Water Project was approved by the Marina Coast Water District in 2005; however, only portions of the recycled water distribution system have been built and no recycled water has been delivered to urban users. If not committed to use with recycled water for irrigation at the time of GWR Project construction, the MRWPCA may pursue using a portion or portions of the pipeline originally proposed for the Recycled Water Project by Marina Coast Water District (i.e., converting the purpose of the pipeline for use by the GWR Project). MRWPCA is exploring the feasibility of several options, including shared use of the pipeline with Marina Coast Water District, use of the pipeline by the GWR Project only, and construction of a new parallel pipeline within the same or a parallel right of way and easement, including accommodating any regulatory-required separation distances from pipelines carrying potable and recycled water.

- Product Water Conveyance Alignment Option 2 would follow a portion of the potable product water conveyance pipeline alignment of Cal-Am's proposed desalination project that is currently the subject of California Public Utilities Commission application A.12-04-019. The pipeline alignment would start at the northern boundary of the Regional Treatment Plant access road, then

---

9 The RTP's existing Waste Discharge Requirements permit allows up to 375,000 gallons per day of concentrate to be disposed through the outfall without amendment or revision to the permit; the GWR Project would exceed that amount so would require a permit amendment.

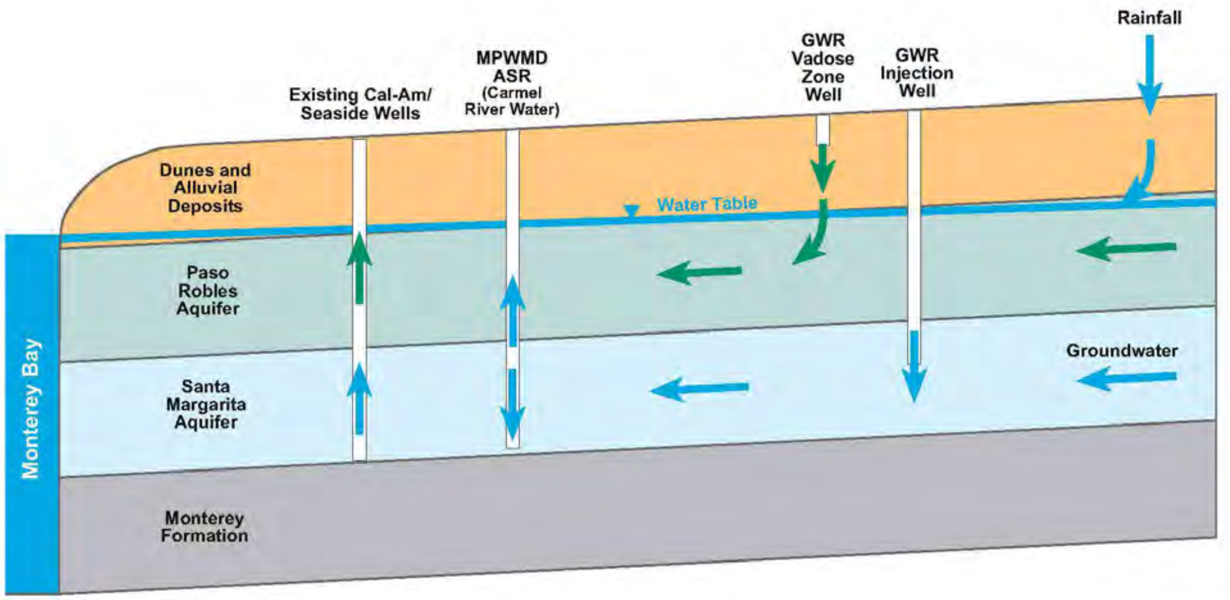
follow Charlie Benson Road to the west to Del Monte Boulevard. Alternatively, the pipeline to Del Monte Boulevard could follow the existing MRWPCA outfall pipeline alignment from the western boundary of the Regional Treatment Plant. This pipeline alignment would turn south on Del Monte Boulevard and be located either within the roadway or within land owned by the Transportation Agency for Monterey County adjacent to the roadway. After Del Monte Boulevard crosses under Highway 1, the pipeline is currently proposed to be within or parallel to the Transportation Agency's land that follows the former rail line in that location. The pipeline would continue south past Fort Ord Dunes State Park and into the City of Seaside turning east at Auto Center Parkway and Del Monte Boulevard. At this point, the pipeline would turn east following Auto Center Parkway/La Salle Avenue until either Lincoln or Havanna Streets to connect the pipeline to San Pablo Avenue. For more information about this alignment option, see the relevant CPUC NOP dated October 2012 at: www.cpuc.ca.gov/Environment/info/esa/mpwsp/index.html.

Each pipeline alignment option would also require one or more pump stations, flow control valves, and other appurtenant facilities. In addition, pipelines to connect the above alignment options to the coastal and/or inland recharge sites (described below) would be required. The selection of the appropriate pipeline alignment/locations and/or performance standards for determining the locations will be assessed as part of a feasibility study that MRWPCA is currently conducting.

### *Replenishment/Recharge Facilities*

The GWR Project would include subsurface groundwater recharge facilities, including shallow (or vadose zone) and deep injection wells located at inland and, if feasible, coastal locations within the Seaside Basin. The vadose zone wells would inject water into the unsaturated soils overlying the uppermost aquifer (the unconfined Paso Robles Aquifer), and the deeper wells would directly replenish the confined Santa Margarita Aquifer. A conceptual diagram of the GWR Project recharge operations is provided in **Figure 4**.

**Figure 4. GWR Recharge Concept Schematic**



With groundwater levels currently below sea level in both the shallower Paso Robles and deeper Santa Margarita aquifers, recharge into both aquifers would be beneficial for protection against seawater intrusion. Most of the existing groundwater pumping for potable use is from wells perforated in the Santa Margarita Aquifer. Accordingly, the Santa Margarita Aquifer is targeted to receive most of the GWR Project water through direct injection. The GWR Project may also recharge high quality water into the Paso Robles Aquifer using shallower vadose zone wells. This proposed configuration of injection wells is intended to provide maximum flexibility for well operation and for optimizing both short-term groundwater production and long-term storage in the Basin.

The design for injection wells at each location has been developed based on the current understanding of the subsurface conditions and typical well capacities. The groundwater modeling evaluation to be conducted as part of the EIR will be used to optimize the number, type, location, and design of GWR Project wells. The following sections describe the proposed inland and coastal recharge facilities.

*Inland Recharge Facilities*. The inland recharge location is assumed to include four deep injection wells and four vadose zone wells that would be located in an approximate 3,000-foot long strip of land about 1,000 feet south of Eucalyptus Road and east of General Jim Moore Boulevard. MRWPCA has been working with the City of Seaside and the Fort Ord Reuse Authority to identify an acceptable location for the proposed inland recharge facilities, and the location that currently appears to be feasible is a City-planned utility corridor as shown in **Figure 2**. Wells would be placed approximately 1,000 feet apart to minimize pumping interference between the wells. Collectively, the eight wells at the inland location would be designed to recharge up to approximately 6,000 gallons per minute (gpm) of water into the Seaside Basin to allow for backup, well maintenance, and other operational benefits (such as optimization of replenishment effectiveness) while still meeting the annual volume objectives. It is anticipated that recharge amounts allocated to each well type and target aquifer could readily be adjusted based on basin conditions that will be determined through ongoing monitoring. Monitoring wells would be constructed in key locations surrounding the recharge facilities to measure water quality and water levels and to measure for tracer constituents during tracer tests that may be required by regulatory agencies. Well operations will be adapted to the results of the monitoring so that the GWR Project continually complies with applicable regulatory and permitting requirements established to protect human health and water quality.

*Coastal Recharge Facilities.* The coastal recharge facilities would include three deep injection wells and four vadose zone wells located on two undeveloped parcels immediately east of Highway 1 and west of the Bayonet and Black Horse Golf Course, as shown in **Figure 2**. Collectively, these wells would be able to recharge about 3,150 gpm of water. Due to the shallower water table at the coast, vadose zone wells would be shallower, and the long-term ability of the coastal wells to replenish both the Santa Margarita and Paso Robles aquifers would likely be less than the replenishment ability of the inland wells. The locations for the proposed coastal recharge facilities were determined based on an analysis of available land and known aquifer characteristics. The Seaside Watermaster requested the inclusion of the coastal recharge facilities in the GWR Project due to the potential benefit they may provide to preventing seawater intrusion and that organization has begun an analysis of the potential benefits of these facilities on the Seaside Basin.

*Maintenance and Monitoring Characteristics.* As previously described, the GWR Project would be operated based on a total annual recharge volume of 3,500 AFY to replace water supplies for Cal-Am's Monterey District service area. It is anticipated that well maintenance and rehabilitation would occur on an as-needed basis. A monitoring program, including tracer tests if required by regulatory agencies, would be implemented and coordinated with other ongoing monitoring programs in the Seaside Basin to allocate water between vadose zone and deep injection wells, and to ensure adequate residence time of the GWR Project water in the Seaside Basin in compliance with regulatory and permitting requirements adopted to protect public health. The GWR Project would be designed to allow for operational flexibility, allowing variation in the amounts of recharge by well over time.

### *Extraction*

After the GWR Project water achieves residence time in the Seaside Basin in accordance with regulatory requirements, extraction of groundwater that includes GWR Project water would occur using existing potable wells, disinfection treatment processes, and distribution systems. No new extraction wells are proposed as part of the GWR Project. Because the GWR Project water would be produced in accordance with California Department of Public Health requirements which are protective of public health, and because the water would meet the applicable residence time requirements within the groundwater basin, no additional treatment beyond current operations would be required after the water is extracted. The amount and quality of water to be extracted and used would be monitored pursuant to applicable regulatory requirements.

## Construction Methods and Schedule

The GWR Project is proposed to be constructed with typical construction methods and equipment, although directional/horizontal drilling may be used for potential source water pipeline crossing(s) of the Salinas River and installation through major intersections along the pipeline corridor. A schedule has been developed for the planning, design, and construction components of the project with a target date of December 2016 for initial groundwater recharge activities to commence.

## Permits and Agreements Anticipated to be Required

As previously discussed, the Monterey Peninsula Water Management District, MRWPCA, and Cal-Am jointly entered into a Groundwater Replenishment Project Planning Term Sheet and Memorandum of Understanding to Negotiate in Good Faith on April 20, 2012. MRWPCA would need to enter into other agreements with entities/agencies who may control the source waters and rights of way, including but not limited to: 1) Monterey County Water Resources Agency to obtain water from Blanco Drain and Reclamation Ditch sources; 2) Monterey County Water Resources Agency, Marina Coast Water District, or both, for use of Regional Treatment Plant effluent and use of various water conveyance facilities and rights of way; and 3) the City of Salinas for source water from its Treatment Plant and stormwater system, and for possible electrical power purchase. MRWPCA would also need to enter into a water purchase agreement with the Monterey Peninsula Water Management District (contingent on a water purchase agreement between Cal-Am and the Monterey Peninsula Water Management District) for the GWR Project water. Other agreements not currently identified may also be required.

**Table 1** is an initial list of agencies and entities that may be involved in permitting and/or approving one or more aspects of the GWR Project. This list is preliminary and may require revision as the GWR Project's design, including construction and operational characteristics, are further developed.

| Table 1: Potential Permits and Approvals Required | |
|---|---|
| **Agency /Entity** | **Permitting Regulation/Approval Requirement** |
| **Federal Agencies** | |
| U.S. Environmental Protection Agency | Class V Underground Injection Control Program (Part C, Safe Drinking Water Act [SDWA]) |
| Monterey Bay National Marine Sanctuary | Review and coordination of all RWQCB 404, Section 10, and NPDES permits |
| U.S. Fish and Wildlife Service | Endangered Species Act compliance (ESA Section 7 consultation) |
| | Fish and Wildlife Coordination Act (16 USC 661-667e; Act of March 10, 1934; ch. 55; 48 stat. 401) |
| U.S. Dept. of Interior: NOAA – Fisheries | Endangered Species Act compliance (ESA Section 7 consultation) |
| Army Corps of Engineers | Nationwide Section 404 Permit (Clean Water Act, 33 USC 1341) |
| | Section 10, Rivers and Harbors Act Permit (33 U.S.C. 403) |
| Federal Aviation Administration | Form SF 7460-1 Notice of Proposed Construction & Alteration for Airport Airspace Aeronautical |
| **State Agencies** | |
| California Public Utilities Commission | Coordination regarding the MPWSP Certificate of Public Convenience and Necessity (Application No. 12-04-019) |
| State Water Resources Control Board, Regional Water Quality Control Board | General Construction Activity Storm Water Permit (WQO 99-08-DWQ) |
| | Water rights permit for development of new surface water diversions |
| | Waste Discharge Requirements (Water Code 13000 et seq.) |
| | 401 Water Quality Certification (CWA Section 401) |
| | National Pollutant Discharge Elimination System (NPDES) Permit (CWA Section 402) |
| California State Lands Commission | Right-of-Way Permit (Land Use Lease) (California Public Resource Code Section 1900); Lease amendment |
| California Department of Fish and Wildlife | Incidental Take Permits (CA Endangered Species Act Title 14, Section 783.2) |
| | Streambed Alteration Agreement (California Fish and Game Code Section 1602) |
| California Coastal Commission | Coastal Development Permit (Public Resources Code 30000 et seq.) |
| California Department of Public Health | Permit to Operate a Public Water System (California Health and Safety Code Section 116525) |
| | Approval for Recharge of Highly Treated Water |
| California Department of Transportation | Encroachment Permit (Streets and Highway Code Section 660) |
| California State Historic Preservation Officer | Section 106 Consultation, National Historic Preservation Act (16 USC 470) |
| California State University Monterey Bay | Right of Way Agreements and/or Easements |
| **Regional/Local Agencies** | |
| City of Salinas | Electricity Power Purchase Agreement |
| Cities of Seaside and Marina, Sand City, Salinas (potential) | Use Permits, encroachment/easement permits, grading permits and erosion control permits may be required pursuant to local city/County codes. |
| Fort Ord Reuse Authority | Coordination with FORA for Right of Entry |
| Monterey Bay Unified Air Pollution Control District | Authority To Construct (Local district rules, per Health and Safety Code 42300 et seq.) and Permit To Operate (Local district rules) |
| Monterey County Health Department, Environmental Health Division | Well Construction Permit (MCC, Title 15 Chapter 15.08, Water Wells) |
| | Hazardous Materials Business Plan (Health and Safety Code Chapter 6.95) |
| | Hazardous Materials Inventory (Health and Safety Code Chapter 6.95) |
| | Review of Discharges/WDR modifications |
| | Variation on Monterey County Noise Ordinance (MCC 10.60.030) |
| Monterey County Public Works Department | Encroachment Permit (Monterey County Code (MCC) Title 14 Chapter 14.040) |
| Monterey County Resource Management Agency | Use Permit (MCC Chapter 21.72 Title 21) may be required pursuant to County codes. |
| | Coastal Development Permit. (Public Resources Code 30000 et seq.) |
| | Grading Permit (M.C.C., Grading and Erosion Control Ordinance, Chapter 16.08 – 16.12) |
| | Erosion Control Permit (MCC, Grading and Erosion Control Ordinance, Chapter 16.08 – 16.12) |
| Monterey County Water Resource Agency | Coordination/agreements for components within MCWRA-controlled waterways and involving the Castroville Seawater Intrusion Project and Salinas Valley Reclamation Project |
| Monterey Peninsula Water Management District | Water System Expansion Permit (Monterey Peninsula Water Management District Board of Directors Ordinance 96) |
| Monterey Reg. Waste Management District | Electric Power Purchase Agreement |
| Seaside Basin Watermaster | Permit for Injection/Extraction |
| Transportation Agency of Monterey County | Easement |
| Water Agencies (other) | Participation/purchase agreements |
| **Private Entities** | |
| Landowners | Land lease/sale; easements and encroachment agreements |
| California American Water Company | Water purchase agreement with Monterey Peninsula Water Management District |
| PG&E | Electric Power Will-Serve Letter/Purchase Agreement |

## Environmental Effects to be Analyzed

The GWR Project EIR will evaluate potential environmental effects associated with construction, operation, and maintenance activities. The EIR will assess the following issues of potential environmental effect:

*Aesthetic Resources*: Project facilities would be sited in potentially scenic and open space areas; however most facilities would be underground or located on existing water and wastewater facility sites. Those facilities that are not located on existing water and wastewater facility sites would be designed to visually blend into the environment through use of vegetative screening and/or appropriate paint colors. The EIR will evaluate visual/aesthetic impacts related to the GWR Project's above-ground facilities.

*Air Quality and Greenhouse Gas Emissions*: The EIR will evaluate construction- and operation-related emissions of criteria air pollutants. The GWR Project will be evaluated in accordance with all applicable federal, state, and regional rules and guidelines. Potential human health risks at nearby sensitive receptors from emissions of diesel particulate matter and toxic air contaminants during construction and operations will be addressed. The EIR will also address greenhouse gas (GHG) emissions during construction and operations, and describe any potential conflict the GWR Project may have with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG.

*Biological Resources*: The EIR will evaluate potential impacts on terrestrial special-status animal and plant species, sensitive habitats, mature native trees, and migratory birds believed to occur in the GWR Project area. The GWR Project may result in changes to the quantity and quality of the treatment plant effluent discharged through the existing MRWPCA outfall to Monterey Bay; therefore, potential effects on marine resources will be evaluated. The EIR will include a summary of the federal Endangered Species Act Section 7 compliance activities and will recommend feasible mitigation measures to reduce significant impacts on biological resources.

*Cultural Resources*: The EIR will review cultural resource records and evaluate potential impacts on historic, archaeological, and paleontological resources, and human remains in the Project area. The EIR will include a summary of the National Historic Preservation Act Section 106 compliance activities. Standard mitigation measures to protect cultural resources will be included in the EIR.

*Geology and Soils*: Construction and operation will occur in a seismically active region. As such, the proposed GWR Project structures could be subject to potential seismic and geologic hazards. The EIR will identify potential seismic, liquefaction, landslide, soil erosion, and expansive soil impacts expected to result from development of the proposed GWR Project. Standard building requirements would be included to protect buildings and structures from seismic risks.

*Hazards and Hazardous Materials*: The EIR will summarize documented soil and groundwater contamination in the Project area, and evaluate the potential for hazardous materials to be encountered during construction. The analysis will also consider the proper handling, storage, and use of hazardous chemicals that may be used during construction and operation. Existing hazardous materials regulatory requirements would be followed to protect workers and the public from exposure to hazardous materials. Airport safety hazards will also be addressed.

*Hydrogeology and Groundwater Quality*: Construction and operation of the Project could affect groundwater levels and quality in the Seaside, Carmel Valley, and Salinas Valley Groundwater Basins.

Through the use of groundwater modeling and hydrogeologic analyses, the EIR will evaluate changes in local groundwater quality, storage, and levels within the groundwater basins as a whole and their subbasins, as appropriate. Potential effects on the seawater/freshwater interface (i.e., seawater intrusion) will also be evaluated. The project would be designed to comply with California Department of Public Health and Regional Water Quality Control Board standards and requirements to protect public health and water quality.

*Hydrology and Surface Water Quality*: Construction and operation of the Project could affect surface water quality and hydrologic systems/processes in the construction areas. Potential impacts to be evaluated include alteration of drainage patterns and increase in stormwater flows due to increase in the amount of impervious surfaces, and degradation of surface water quality as a result of erosion and sedimentation, hazardous materials release during construction, and construction dewatering discharges. The project would be designed to comply with standard construction and operational requirements and permits under the National Pollutant Discharge Elimination System and Waste Discharge Requirements.

*Land Use and Planning*: Implementation of the proposed GWR Project includes construction and operation of new facilities and water supply infrastructure. The EIR will evaluate the proposed GWR Project for consistency with established plans, policies, and regulations, as well as compatibility with the existing and future land use patterns in the GWR Project area, including adjacent land uses. The proposed GWR Project's functional and physical compatibility with surrounding uses will also be analyzed. Because most conveyance facilities will be underground, and because the proposed treatment facilities would be located at the existing Regional Treatment Plant, significant effects on land use patterns are not anticipated.

*Noise*: The EIR will evaluate construction- and operation-related noise and vibration increases and associated effects on ambient noise levels, relative to applicable noise standards, and will address the potential for impacts to nearby sensitive land uses.

*Population and Housing*: Implementation of the proposed GWR Project would enhance the reliability of the water supply within the Monterey Peninsula area, but the project would provide replacement water rather than new water to serve growth. The EIR will describe the relationship of water supply to population growth in the area. The EIR will identify current population and employment projections and identify local planning jurisdictions with the authority to approve growth and mitigate secondary effects of growth.

*Transportation and Traffic*: The EIR will generally describe the types of construction activities that would generate temporary increases in traffic volumes along local and regional roadways. The installation of pipelines within or adjacent to road rights-of-way could result in temporary lane closures and traffic delays. The analysis will use information about construction activities (e.g., the numbers of trucks and workers) to the extent such information is available. The analysis will generally describe the types of traffic control plan measures that would be used to reduce impacts to vehicular traffic, traffic safety hazards, public transportation, and other alternative means of transportation.

*Other Environmental Issues*: Other environmental issues that will be evaluated in the EIR include the Project's potential impacts on public services and utilities, including the Project's beneficial effect on water supply reliability; water rights for project source water; effects on energy delivery systems due to fossil-fuel resource use; and effects on agricultural, mineral, and forest resources. The EIR also will evaluate potential growth-inducing impacts that could result from implementation of the Project. The EIR will address whether the Project could result in impacts that would be significant when combined with the impacts of other past, present and reasonably foreseeable future projects (i.e., cumulative impacts).

*Alternatives*: California Environmental Quality Act requires that an EIR evaluate a reasonable range of feasible alternatives to the project, or to the location of the project, that would attain most of the basic project objectives but that could avoid or substantially lessen any of the significant effects of the project. The EIR will identify the potentially significant impacts of the proposed Project. The findings of the EIR impact analysis will guide the refinement of an appropriate range of feasible alternatives to be evaluated in the EIR that would avoid or substantially lessen significant impacts, while still meeting the project objectives. MRWPCA is seeking comments from agencies, stakeholders and the public regarding feasible alternatives for evaluation in the EIR. The EIR will include, at a minimum, a discussion of impacts associated with the No Project Alternative.

## Environmental Review Process

The MRWPCA has determined that the GWR Project may have a significant effect on the environment and an EIR is required. The MRWPCA is the Lead Agency for California Environmental Quality Act purposes. The MRWPCA anticipates seeking State Revolving Fund funding from the California State Water Resources Control Board. Therefore, the requirements of California Environmental Quality Act-Plus will be met and the analysis in the EIR will be conducted in compliance with those requirements. Currently, the potential for federal funding or permitting for the project is unknown; however, if a federal agency must issue a discretionary permit for the GWR project or approve some component of the project such as funding, compliance with the National Environmental Policy Act may be necessary.

The first step in the environmental review process is the formal public scoping process, for which this NOP has been prepared. Following the public scoping period, the Draft EIR will be prepared and circulated for a 45-day public review period. Public comments on the Draft EIR will be accepted in writing during the review period or verbally at a formal public meeting to be held by the MRWPCA. The MRWPCA will then prepare written responses to the comments on environmental issues raised during the public review period, and a Response to Comments document will be prepared. That document will be considered by the MRWPCA, along with the Draft EIR and any revisions to the draft based on responses to comments, for certification as the Final EIR.

## Scoping and Public Meeting

The California Environmental Quality Act mandates that a scoping meeting be held for projects of statewide, regional or area-wide significance. To ensure that the public and regulatory agencies have an opportunity to ask questions and submit comments on the scope and content of the EIR, a scoping meeting will be held during the NOP review period. The location and date of the scoping meeting is:

**Date: Tuesday, June 18, 2013**

**Time: 6:00-8:00 PM**

**Location: Oldemeyer Center, Dance Room (986 Hilby Avenue, Seaside, CA 93955)**

The scoping meeting will start with a brief presentation providing an overview of the proposed GWR Project. Following the presentation, interested parties will be provided an opportunity to interact with MRWPCA staff and its technical consultants. Participants are encouraged to submit written comments; comment forms will be supplied at the scoping meeting. Written comments may also be submitted anytime during the NOP scoping period to the mailing address, fax number, or email address listed below.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice. The scoping comment period will close at **5:00 PM** on **Tuesday, July 2, 2013.** Please include a name, address, email address, and telephone number of a contact person in your agency for all future correspondence on this subject. **Please send your comments to:**

**Monterey Regional Water Pollution Control Agency**
**ATTN: Bob Holden**
**5 Harris Court, Bldg D**
**Monterey, CA 93940**

**Phone: (831) 372-3367 or (831) 422-1001**
**Fax: (831) 372-6178**
**E-mail: GWR@mrwpca.com**

This Notice of Preparation is available electronically at the MRWPCA website:

www.mrwpca.org.

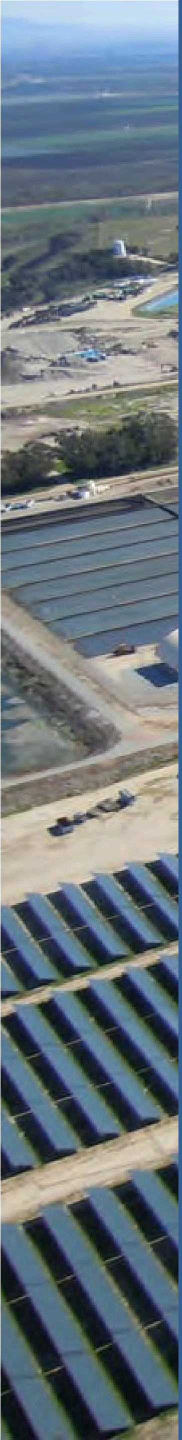
GWR PUBLIC SCOPING MEETING - PRESENTATION

JUNE 18, 2013



# Monterey Peninsula Groundwater Replenishment (GWR) Project

## Environmental Impact Report Scoping Meeting

Tuesday, June 18, 2013

Oldemeyer Center, Seaside

6:00 - 8:00 PM

# Agenda

1) Introductions
2) Overview of Groundwater Replenishment Project
3) Overview of CEQA / Scoping Requirements
4) EIR Environmental Issues / Topics
5) Agency and Public Comments

# GWR CEQA & Technical Teams

**Lead Agency**

Monterey Regional Water Pollution Control Agency

**Project Partner Agency**

Monterey Peninsula Water Management District

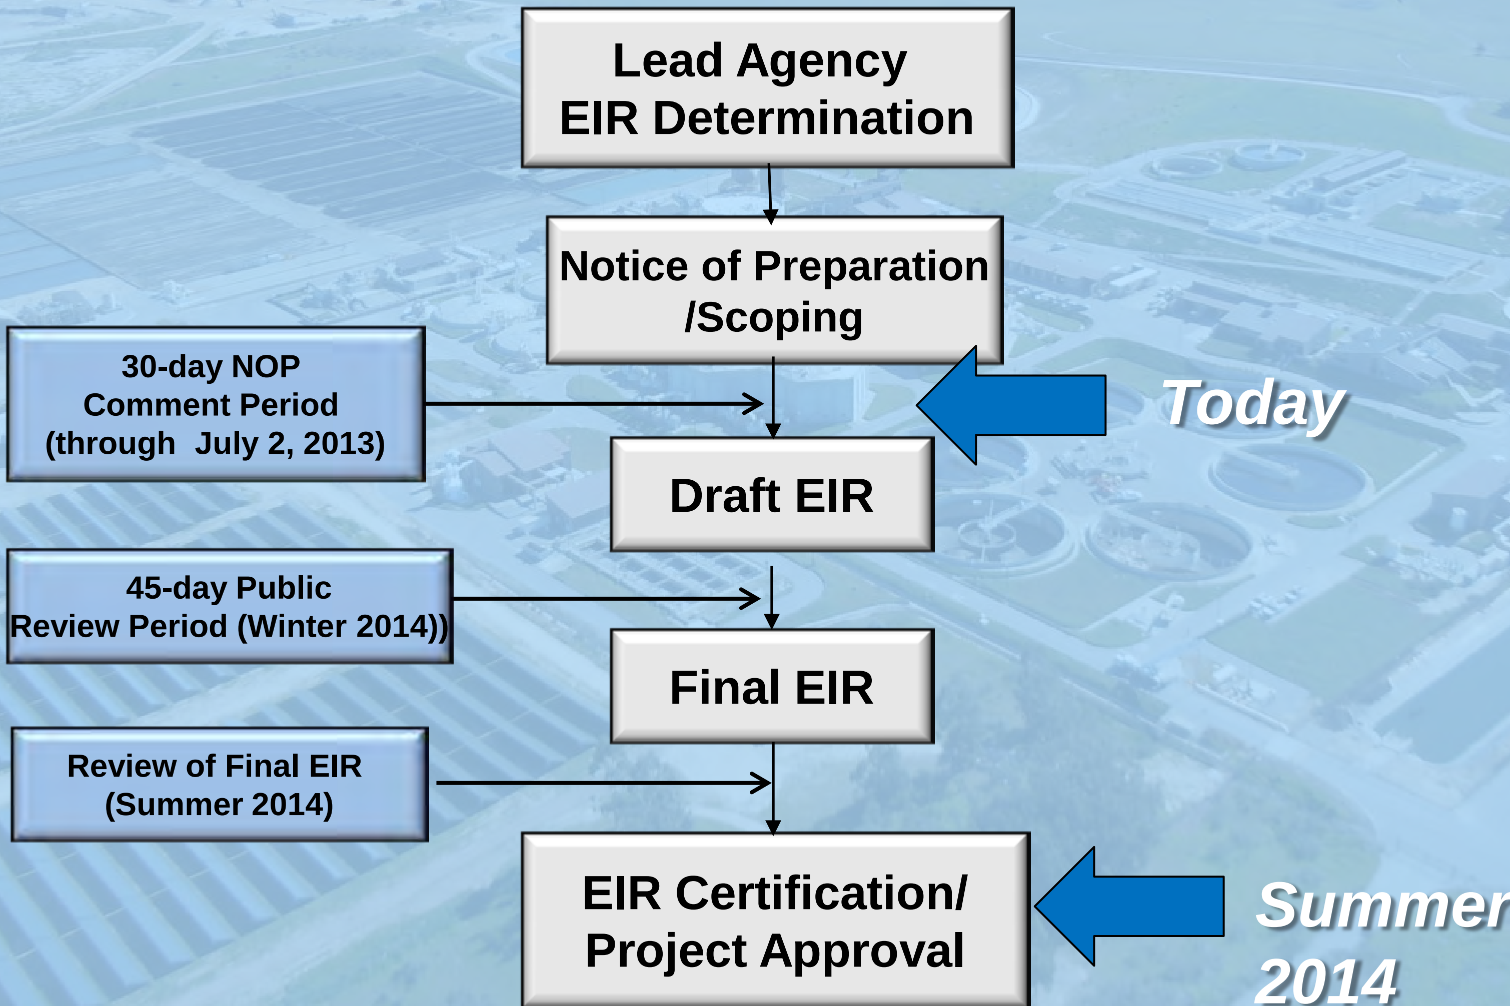
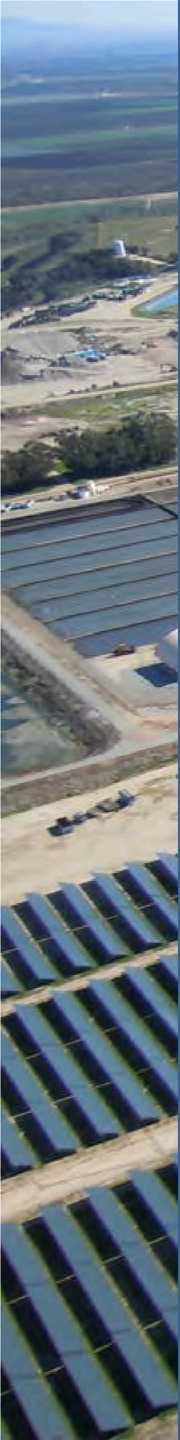
# GWR CEQA Process



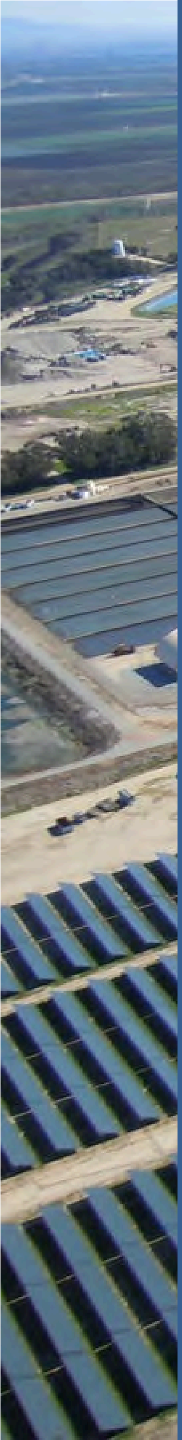


# GWR Overview

To produce and deliver 3,500 AFY high quality treated water for replenishment of the Seaside Basin to reduce Cal-Am diversions from the Carmel River alluvial aquifer.

Facilities would include:

- Source Water Conveyance Facilities
- Treatment Facilities
- Product Water Conveyance Facilities
- Replenishment/Recharge Facilities

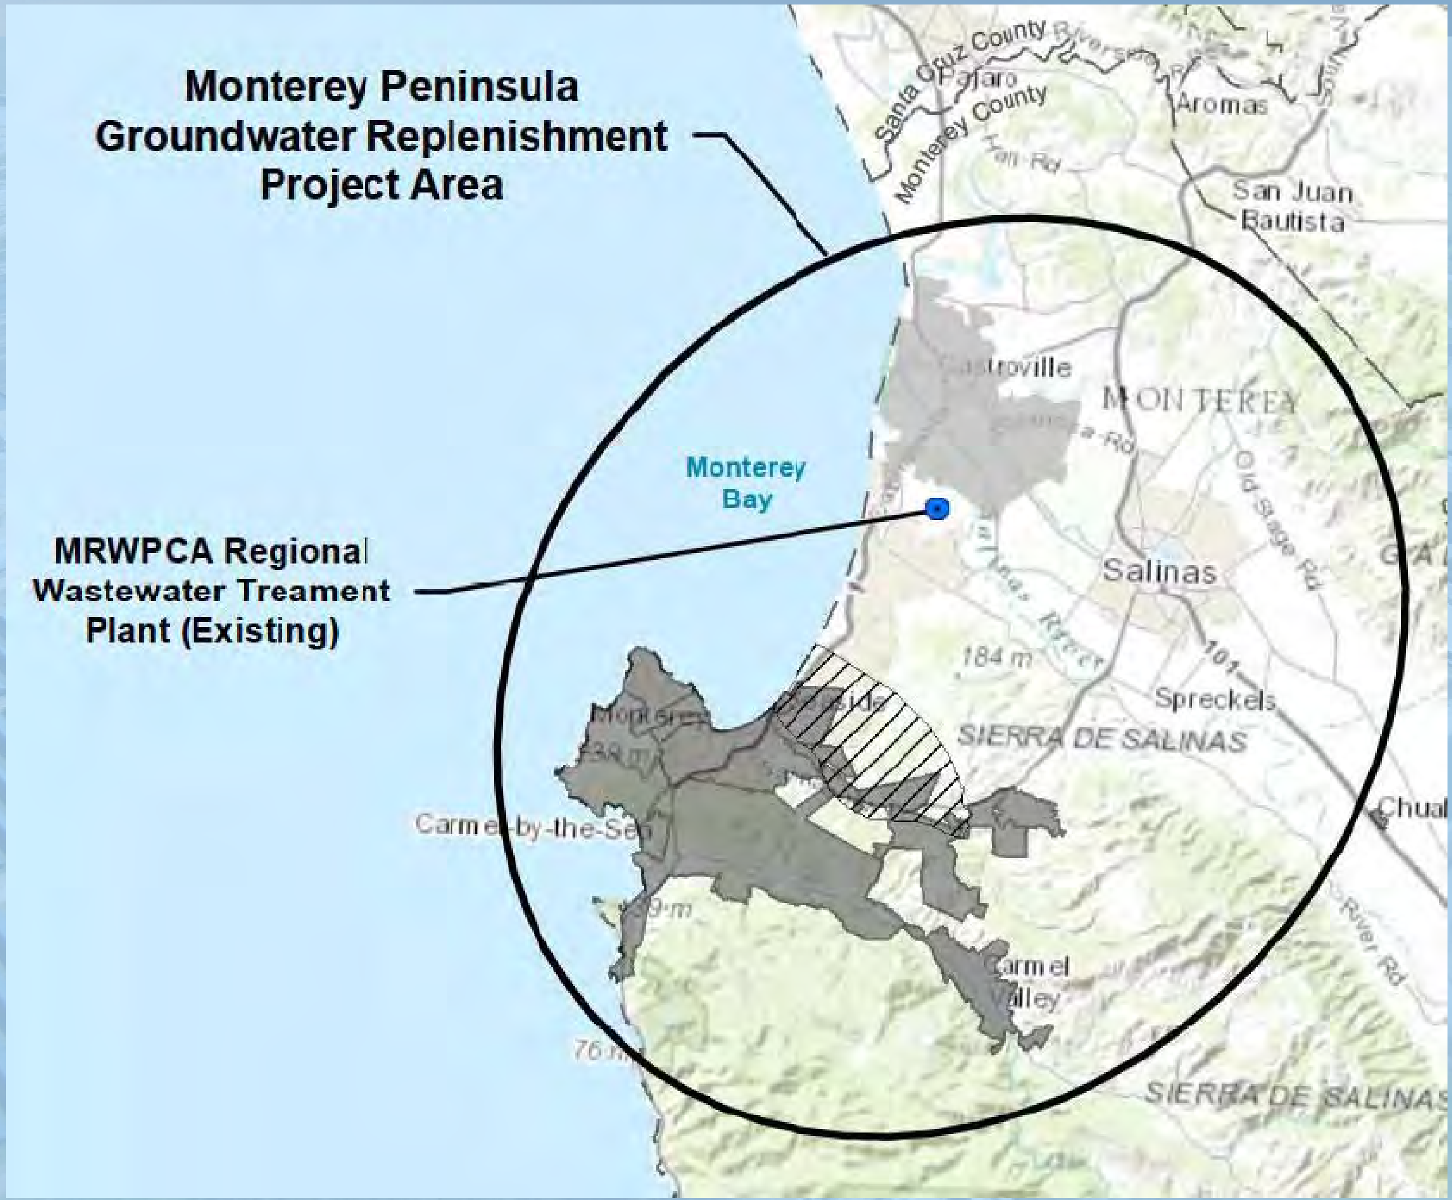


# About MRWPCA

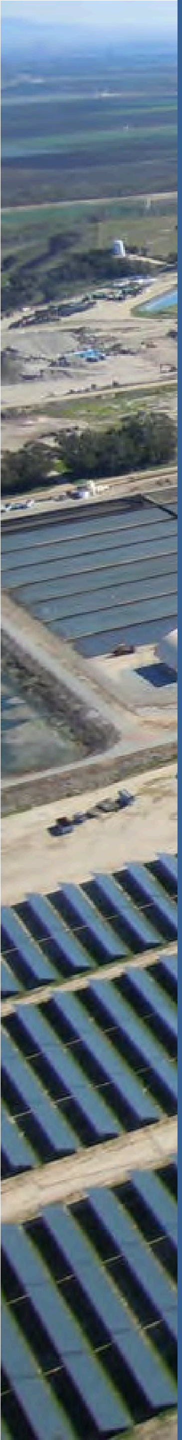
- Operates the regional wastewater treatment plant
- Maintains 25 wastewater pump stations
- Manages the water recycling facility
- Operates the distribution system that provides irrigation water to 12,000 acres of farmland.

*The agency serves Del Rey Oaks, Monterey, Pacific Grove, Salinas, Sand City, Seaside, Boronda, Castroville, Moss Landing, Fort Ord, Monterey County, and Marina.*

# Project Location Overview



# Seaside Groundwater Basin

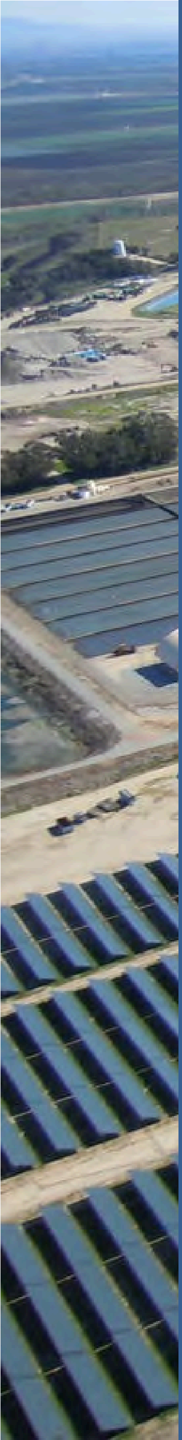


# State and Judicial Orders Reduce Cal-Am Water Supply

- State Water Resources Control Board Order No. WR 95-10 found Cal-Am was diverting more Carmel River water than allowed.
- Cease and Desist Order (CDO) follows that requires new water supply by the end of 2016.
- Seaside Basin Adjudication in 2006 found basin overdraft may result in seawater intrusion; requires reduction in pumping.

# GWR Relationship to Monterey Peninsula Water Supply Project

- Can provide part of the replacement water needed for Cal-Am for CDO and Adjudication.
- Primary goal is to produce 3,500 AFY to reduce Cal-Am’s Carmel River diversions.
- Independent project; can be implemented with or without Monterey Peninsula Water Supply Project, but if built reduces the size of the desalination plant needed.



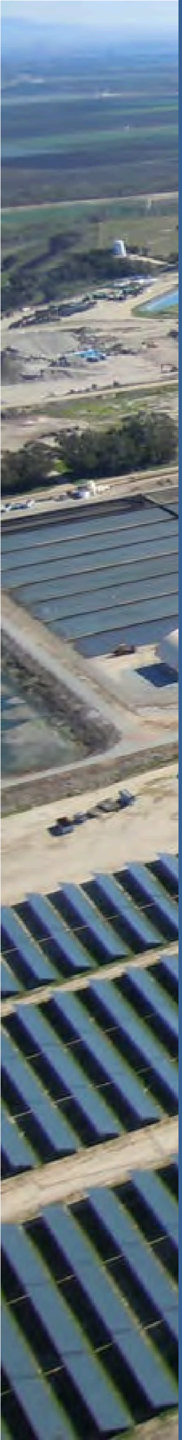
# Primary Project Objectives

Replenish the Seaside Basin with 3,500 AFY of high quality water that would replace a portion of Cal-Am’s water supply by meeting the following objectives:

- Commence operation, or be substantially complete, by end of 2016 or, if after 2016, no later than necessary to meet Cal-Am’s replacement water needs;
- Be cost-effective and capable of supplying reasonably-priced water; and
- Comply with applicable water quality regulations intended to protect public health.

# Secondary Project Objectives

- Assist in preventing seawater intrusion in Seaside Basin;
- Diversify region’s water supply portfolio; and
- Provide additional water for crop irrigation through the Salinas Valley Reclamation Project and Castroville Seawater Intrusion Project system.



# Overview of GWR Facilities

- **Source Water Conveyance Facilities:** pipelines/pump stations to convey source water to treatment facilities,
- **Treatment Facilities:** pretreatment facilities, a new Advanced Water Treatment Plant at the existing WWTP,
- **Product Water Conveyance Facilities:** to convey water to the Seaside Basin, and
- **Replenishment/Recharge Facilities:** pipelines, deep and shallow (vadose zone) injection wells, and backflush facilities at coast and/or inland within Seaside Basin.

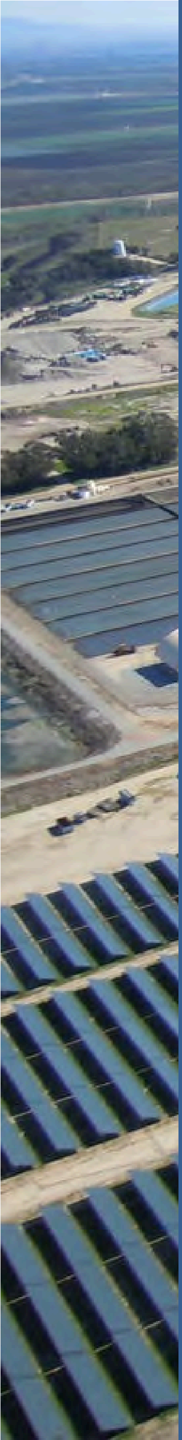
Regulatory-prescribed residence time between injection and extraction



# Source Water Collection

A combination of the following will be processed by the Advanced Water Treatment Plant:

- City of Salinas Treatment Plant water
- Blanco Drain water
- Storm water collection systems of the City of Salinas and other MRWPCA member entities
- Reclamation Ditch water
- Secondary or tertiary effluent from the Regional Treatment Plant

# Source Water Collection

# Salinas Treatment Plant Ponds

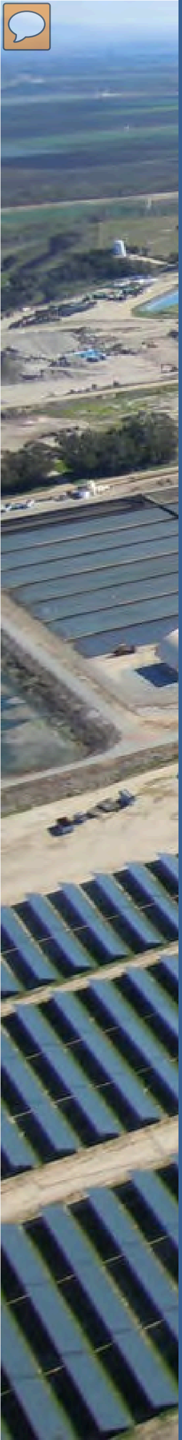
# Blanco Drain

# Salinas Storm Water Outfall

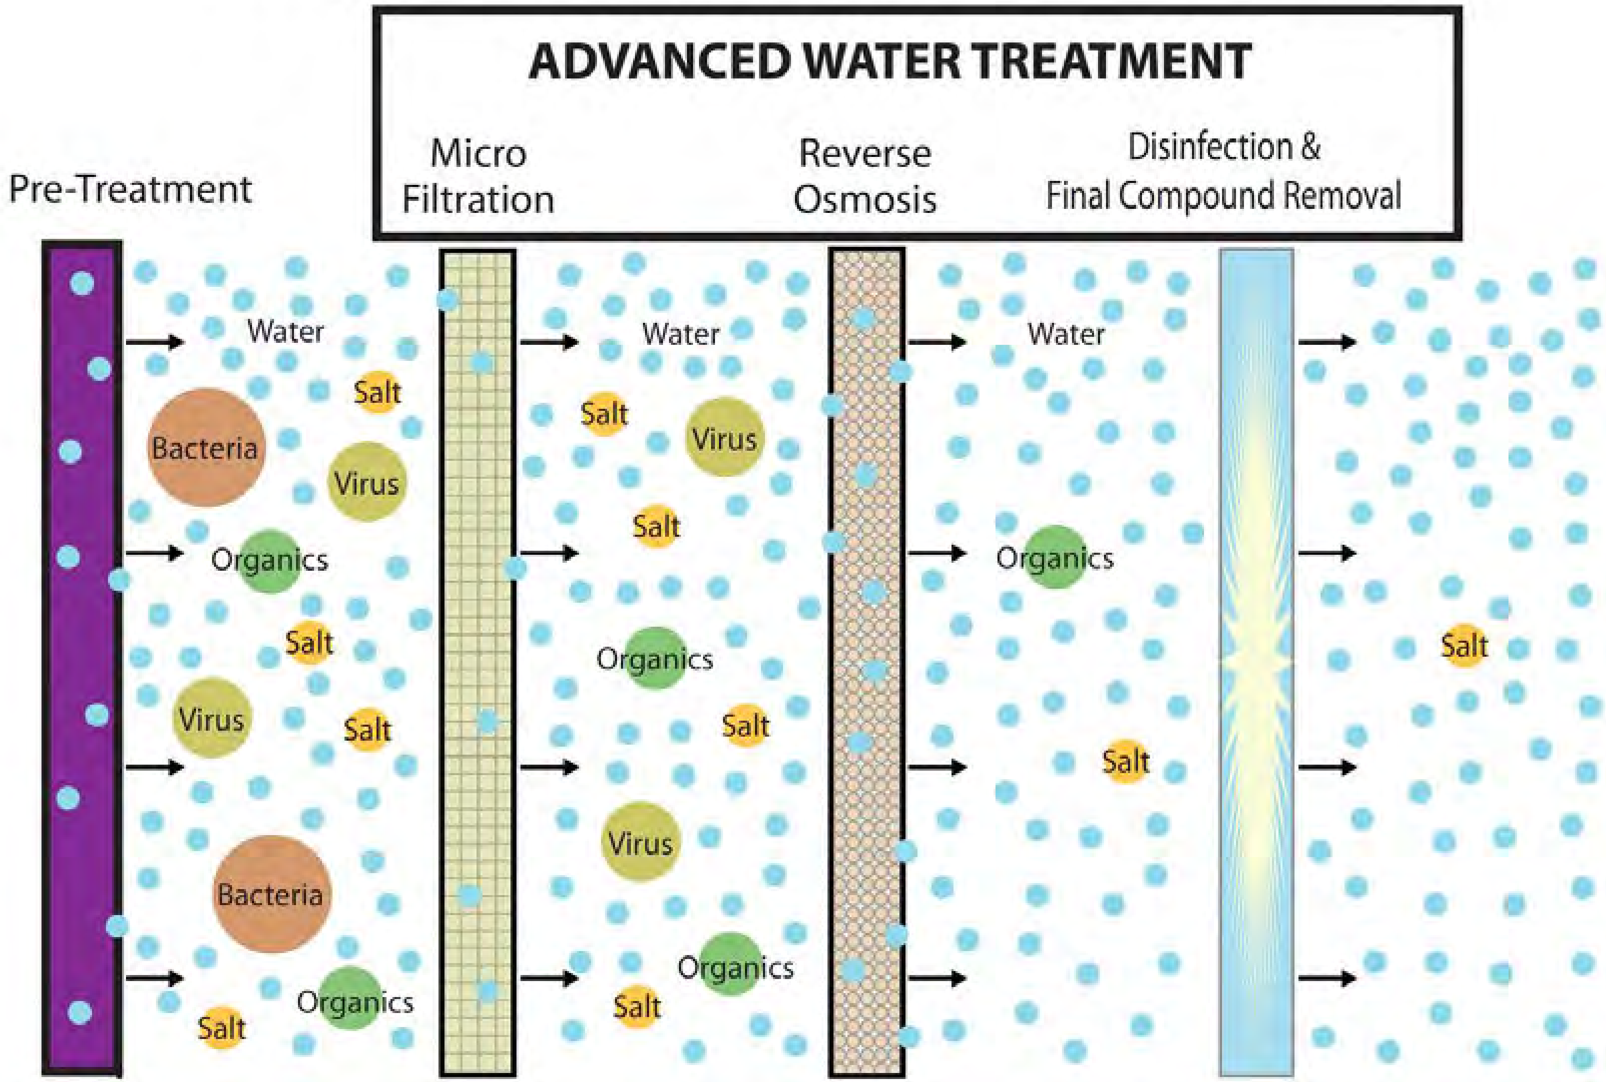
# Salinas Pump Station

# Reclamation Ditch

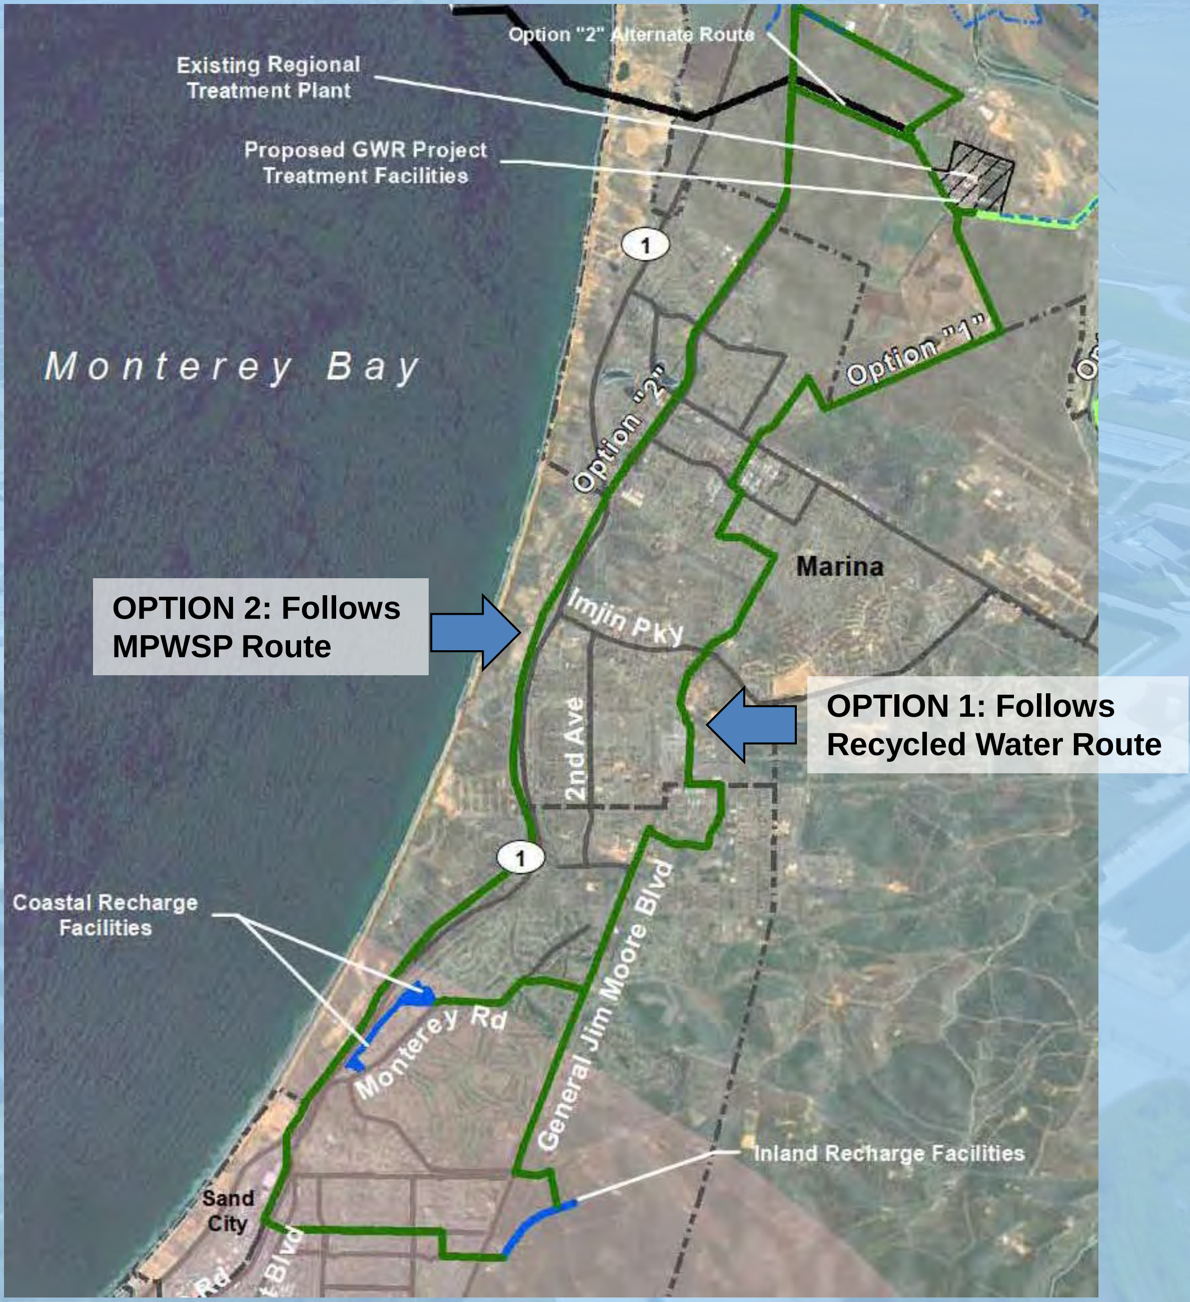
# GWR Treatment Plant Site



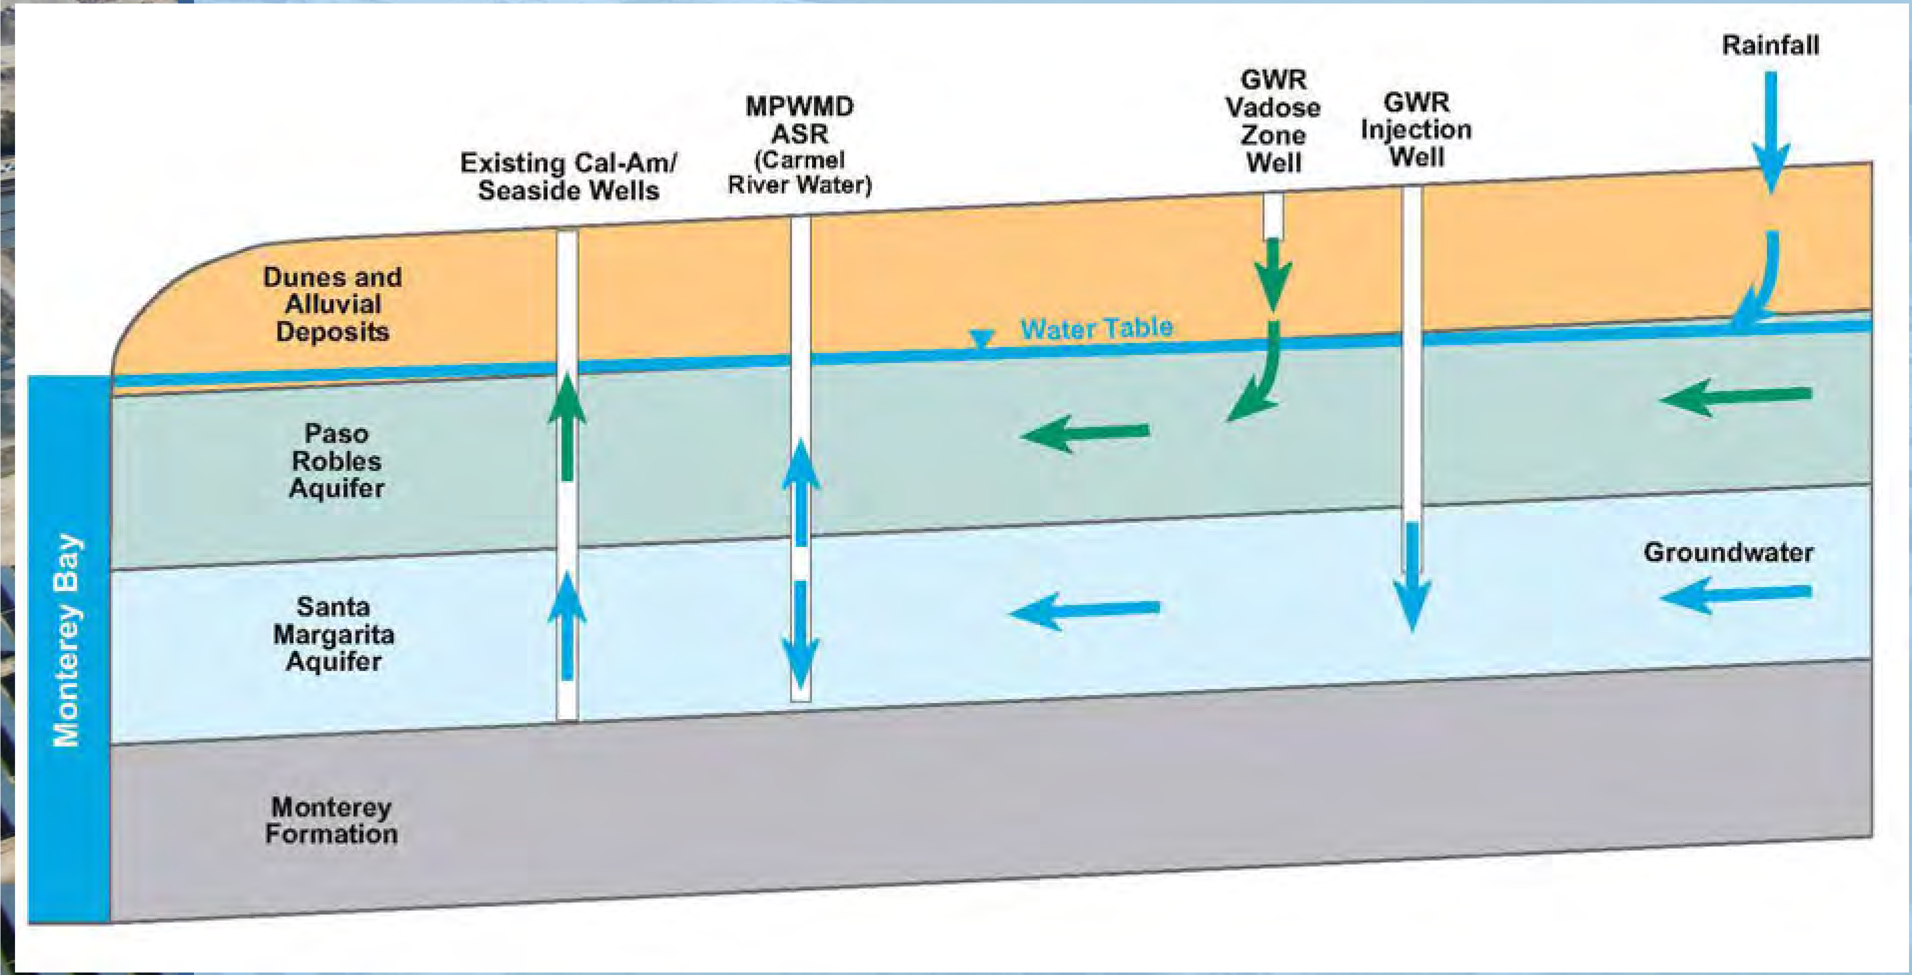
# Proposed Water Purification Process

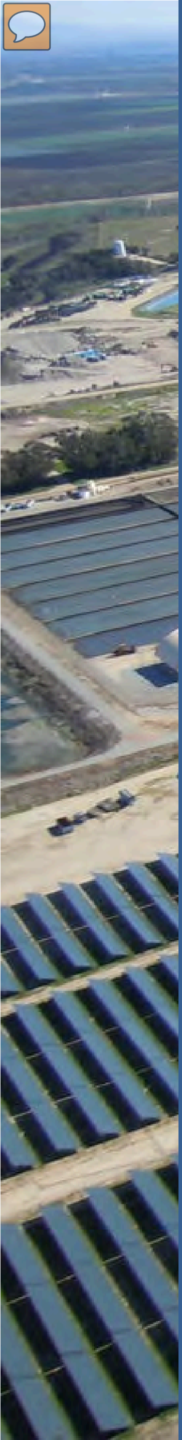


# Product Water Conveyance



# GWR Recharge Concept Schematic

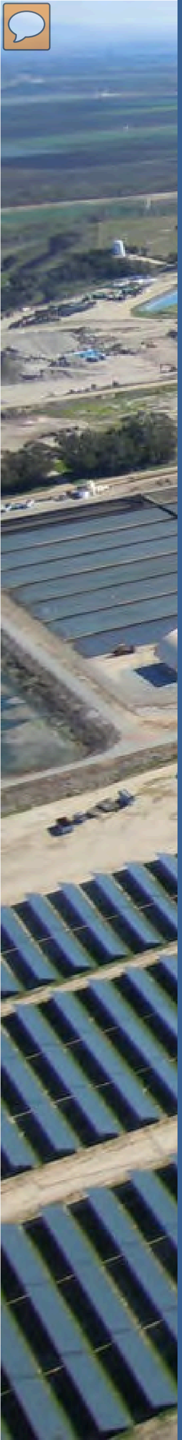




# California Environmental Quality Act Purpose

*CEQA Guidelines §15002(a)*

- Inform decision-making
- Prevent significant damage to environment
- Public disclosure



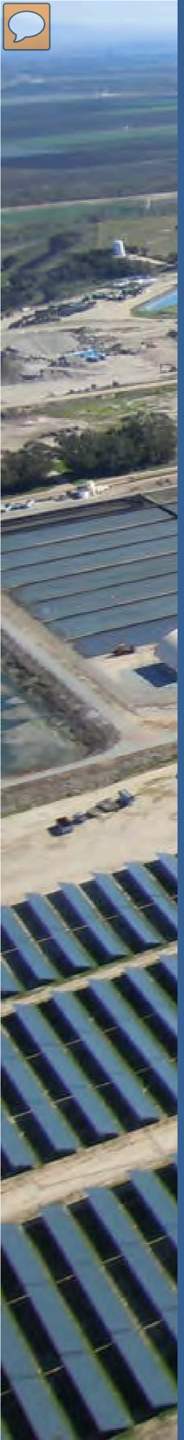
# Environmental Impact Report Purpose

*CEQA Guidelines §15121*

- Disclose the environmental effects of a proposed project
- Identify mitigation measures to avoid, reduce, minimize significant environmental effects
- Evaluate reasonable alternatives

# Key Topics in EIR

- Surface Water Hydrology/Quality
- Groundwater Hydrology/Quality
- Water Supply Quality/Public Health
- Construction vs. Operational Impacts
- Direct and Indirect Adverse Impacts
- Other CEQA-required issues



# Purpose of Meeting: Define Scope/Content of EIR

- Verbal comments and comment cards accepted after presentation tonight
- Please follow-up with written comments today or through July 2nd at 5:00 PM.
- EIR scope /content may be modified per comments
- All comments to be assembled in scoping memo and addressed in EIR

# GWR CEQA Process

# APPENDIX C-3

# GWR PUBLIC SCOPING MEETING – VERBAL COMMENTS OF FLIPCHARTS

# JUNE 18, 2013

GWR Scoping #1
6/18/13

① BILL CARROTHERS
- need outstanding hydrologist (knows Seaside Basin)
- " " water engineer
- " gifted leader

KEITH INTRODUCE TEAM

② RON WEITZMAN - WATERPLUS
- evolved in positive way by not relying on effluent
- EIR: ① toxins in water sources
  - ② - discharge rate to Basin (capacity to inject)
  - ③ - storage facility (will there be losses?)
  - ④ - solar energy
  - ⑤ - diluent requirement
  - ⑥ - flowrate btw injection & extraction wells
  - ⑦ - cost comparison to desal only
  - pollutants different than effluent ("beyond" Orange County)

GWR Scoping #2
6/18/13

③ GEORGE RILEY
- will the EIR explore/include positive/benefical impacts along with negative/adverse impacts
- what are the alternatives to the project?

④ HELEN RUCKER
- went to OCWD / drank the water
- surprised not to see more people here
- what outreach was done?
- make public outreach a priority, reach out to non-experts, normal public

⑤ BILL CARROTHERS
- concern for industrial/environmental hygiene
- potential for upsets at treatment plant
- what is in source water that makes it through treatment to the outfall.

GWR SCOPING #3
6/18/13

⑥ RON WEITZMAN
- can GWR solve the entire water supply issue? (i.e. is desal really needed) (A BIGGER PROJECT)

⑦ HELEN RUCKER
- COST OF GWR, IS IT ON TOP OF THE DESAL PLANT COST?
- CHANGE IN WATER RATES AND EFFECTS ON LOW-MOD INCOME HOUSEHOLDS.

# Appendix C-4

**GWR CEQA Process**

**For More Information**

**(Denise Duffy)**

**Comments on Scope of EIR**

## PUBLIC COMMENTS

**1. Bill Carrothers**

- This project will need an outstanding hydrologist that is very familiar with the Seaside Basin.
- This project with also need a superb water engineer.
- A gifted leader will be essential – Keith Israel (MRWPCA)

**2. Ron Weitzman, WaterPlus (these comments were also submitted in written form)**

WaterPlus suggest that the EIR for the GWR address the following items:

1. Toxins in each potential water source
2. Discharge rate and natural capacity of Seaside aquifer
3. Cost of storage facility for excess effluent
4. Cost of solar energy for a desal-only project
5. Amount of required diluent
6. Flow rate of injection & extraction wells
7. Cost comparison with desal-only project

Justification:

Items 1, 5, and 6 are important because the currently proposed GWR project includes sources of supply water besides sewer water, the principal source in previous versions of the project proposal. These additional sources, as well as sub-surface injection for potable use (rather than to retard saltwater intrusion), go beyond the precedent of Orange County and include pollutants not addressed there. Public Health concerns are a major issue of the project as currently proposed.

Item 2 is important because GWR involves storage of water over time in the Seaside aquifer, which is considered to be quite porous. The capacity of the aquifer and its discharge rate must be determined to estimate the amount of injected water that may be lost prior to extraction. Will this amount this is will adversely affect efforts to retard saltwater intrusion?

Items 3 and 4 are important because a storage facility for excess effluent and solar energy powering desalination are environmentally-friendly alternatives to GWR for the EIR to evaluate. The cost of the storage facility, which would allow farmers to use excess winter effluent in the summer, or the cost of solar energy for desalination may be considerably less than the cost of GWR.

Item 7 is important for the reason just given: Alternatives to GWR that are equally environmentally friendly, while affording lower risk to public health, may cost less than GWR.

**3. George Riley, Citizens for Public Water**

- Will the EIR explore or include any of the positive impacts (benefits) in addition to the negative impacts?
- Will other alternatives to the project (besides those already included)be addressed in the EIR?

**4. Helen Rucker, City of Salinas**

- Concerned about the outreach that was done for this meeting and the project in general, as she was surprised that more residents were not in attendance.
- It is important that "non-experts" are included in the scoping and made aware of project issues.

**5. Bill Carrothers (a second time)**

- Suggested that the EIR include information about industrial and environmental hygiene.
- Suggested that the EIR address the potential for operational failures at the Water Treatment Plant.
- Asked about the quality of water that would be sent to the outfall location as opposed to that of the water sent to Seaside for injection.

**6. Ron Weitzman (a second time)**

- Is it possible that a larger scale version of the GWR project can solve the entire water supply issue, therefore eliminating the need for a desalination plant?

**7. Helen Rucker (a second time)**

- Is the cost of the GWR project greater or less than the cost of a typical desalination plant?
- Who will bear the cost of this project; will local residents with lower incomes be able to afford to live in this area?

# APPENDIX D

## NOP COMMENT LETTERS

SORTED BY DATE RECEIVED AND BRACKETED BY SUB-COMMENT

MAY 30, 2013 THROUGH JULY 2, 2013

# Letter A

From: Bob Holden [mailto:bobh@mrwpca.com]
Sent: Mon 6/17/2013 4:42 PM
To: GWR; Alison Imamura; Valerie J. Young; Denise Duffy
Cc: Mike McCullough; Karen Harris
Subject: Eleanor Citen

All,
Ms. Eleanor Citen, PO Box 2428, Carmel, CA 93921, came to 5 Harris Court, Bldg. D this afternoon about 3:40 PM. She wanted to talk about GWR. She indicated that she will not attend the scoping meeting tomorrow. She doesn't want to drink recycled water. She gave me materials she purchased from Aquafornia (Water Education Foundation) for my education (Bay-Delta Tours, 2013 Water Tours, Western Water magazines, and Viewer's Guide: Drinking Water-Quenching the Public Thirst) . She knew about OCWD and how they are expanding. I told her that I drank water at Orange County. She said she has heard of others drinking it and that it tastes ok. However, she did not think it was safe as it had chemicals from the fields in it. I told her that the California Department of Public Health believes it is safe and that they are looking into direct potable reuse. I explained how direct potable took the advanced treated water and either put it into the drinking water treatment plant or directly into a pipe to the consumers. She wants a project to be built to provide water. She does not want it to include water of wastewater origin. She would like me to go to meetings and get some of the water that Southern California will no longer need for us locally. A-1

She thanked me for listening to her and gave me her card.
Thanks,
Bob

**From:** Ron Weitzman [mailto:ronweitzman@redshift.com]
**Sent:** Tuesday, June 18, 2013 4:40 PM
**To:** GWR
**Subject:** Items Suggested by WaterPlus for Inclusion in the EIR for GWR

ATTN: Bob Holden, Principal Engineer, MRWPCA

WaterPlus suggests that the EIR for GWR address the following items:

1. **Toxins in each potential water source**
2. **Discharge rate and natural capacity of Seaside aquifer**
3. **Cost of storage facility for excess effluent**
4. **Cost of solar energy for a desal-only project**
5. **Amount of required diluent**
6. **Flow rate between injection & extraction wells**
7. **Cost comparison with desal-only project**

Justification:

Items 1, 5, and 6 are important because the currently proposed GWR project includes sources of supply water in addition to sewer water, the principal source in previous versions of the project proposal. These additional sources, as well as sub-surface injection for potable use (rather than to retard saltwater intrusion), go beyond the precedent of Orange County and include pollutants not addressed there. Public B-1

Health concerns are a major issue of the project as currently proposed. B-1 cont.

Item 2 is important because GWR involves storage of water over time in the Seaside aquifer , which is considered to be quite porous. The size of the aquifer and its discharge rate must be determined to estimate the amount of injected water that may be lost prior to its extraction. Whatever amount this is will adversely affect efforts to retard saltwater intrusion. B-2

Items 3 and 4 are important because a storage facility for excess effluent or solar energy powering desalination are environmentally-friendly alternatives to GWR for the EIR to evaluate. The cost of the storage facility, which would allow farmers to use excess winter effluent in the summer, or the cost of solar energy for desalination may be considerably less than the cost of GWR. B-3

Item 7 is important for the reason just given: Alternatives to GWR that are equally environmentally friendly, while affording lower risk to public health, may cost less than GWR. B-4

--Ron Weitzman, for WaterPlus

Letter C

California Water Boards

Edmund G. Brown Jr., Governor
Matthew Rodriquez, Secretary for Environmental Protection

State Water Resources Control Board

JUN 18 2013

Bob Holden
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

Dear Mr. Holden:

NOTICE OF PREPARATION (NOP) FOR MONTEREY REGIONAL WATER POLLUTION CONTROL AGENCY (AGENCY); MONTEREY PENINSULA GROUNDWATER REPLENISHMENT PROJECT (PROJECT); MONTEREY COUNTY; STATE CLEARINGHOUSE NO. 2013051094

We understand that the Agency may be pursuing Clean Water State Revolving Fund (CWSRF) financing for this Project. As a funding agency and a state agency with jurisdiction by law to preserve, enhance, and restore the quality of California's water resources, the State Water Resources Control Board (State Water Board) is providing the following information on the preparation of the California Environmental Quality Act (CEQA) for the Project. C-1

The State Water Board, Division of Financial Assistance, is responsible for administering the CWSRF Program. The primary purpose for the CWSRF Program is to implement the Clean Water Act and various state laws by providing financial assistance for wastewater treatment facilities necessary to prevent water pollution, recycle water, correct nonpoint source and storm drainage pollution problems, provide for estuary enhancement, and thereby protect and promote health, safety and welfare of the inhabitants of the state. The CWSRF Program provides low-interest funding equal to one-half of the most recent State General Obligation Bond Rates with a 20-year term. Applications are accepted and processed continuously. Please refer to the State Water Board's CWSRF website at: www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/index.shtml. C-2

The CWSRF Program is partially funded by the United States Environmental Protection Agency and requires additional "CEQA-Plus" environmental documentation and review. Four enclosures are included that further explain the CWSRF Program environmental review process and the additional federal requirements. The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by federal agencies or their representatives will need to be resolved prior to State Water Board approval of a CWSRF financing commitment for the proposed Project. For further information on the CWSRF Program, please contact Mr. Ahmad Kashkoli, at (916) 341-5855. C-3

It is important to note that prior to a CWSRF financing commitment, projects are subject to provisions of the Federal Endangered Species Act (ESA), and must obtain Section 7 clearance from the United States Department of the Interior, Fish and Wildlife Service (USFWS), and/or the United States Department of Commerce National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) for any potential effects to special-status species. C-4

Please be advised that the State Water Board will consult with USFWS, and/or NMFS regarding all federal special-status species that the Project has the potential to impact if the Project is to be funded under the CWSRF Program. The Agency will need to identify whether the Project will involve any direct effects from construction activities, or indirect effects such as growth inducement, that may affect federally listed threatened, endangered, or candidate species that are known, or have a potential to occur on-site, in the surrounding areas, or in the service area, and to identify applicable conservation measures to reduce such effects. C-5

In addition, CWSRF projects must comply with federal laws pertaining to cultural resources, specifically Section 106 of the National Historic Preservation Act (Section 106). The State Water Board has responsibility for ensuring compliance with Section 106, and must consult directly with the California State Historic Preservation Officer (SHPO). SHPO consultation is initiated when sufficient information is provided by the CWSRF applicant. If the Agency decides to pursue CWSRF financing, please retain a consultant that meets the Secretary of the Interior's Professional Qualifications Standards (www.cr.nps.gov/local-law/arch_stnds_9.htm) to prepare a Section 106 compliance report. C-6

Note that the Agency will need to identify the Area of Potential Effects (APE), including construction and staging areas, and the depth of any excavation. The APE is three-dimensional and includes all areas that may be affected by the Project. The APE includes the surface area and extends below ground to the depth of any Project excavations. The records search request should be made for an area larger than the APE. The appropriate area varies for different projects but should be drawn large enough to provide information on what types of sites may exist in the vicinity. C-7

Other federal requirements pertinent to the Project under the CWSRF Program include the following:

A. Compliance with the Federal Clean Air Act: (a) Provide air quality studies that may have been done for the Project; and (b) if the Project is in a nonattainment area or attainment area subject to a maintenance plan; (i) provide a summary of the estimated emissions (in tons per year) that are expected from both the construction and operation of the Project for each federal criteria pollutant in a nonattainment or maintenance area, and indicate if the nonattainment designation is moderate, serious, or severe (if applicable); (ii) if emissions are above the federal de minimis levels, but the Project is sized to meet only the needs of current population projections that are used in the approved State Implementation Plan for air quality, quantitatively indicate how the proposed capacity increase was calculated using population projections. C-8

B. Compliance with the Coastal Zone Management Act: Identify whether the Project is within a coastal zone and the status of any coordination with the California Coastal Commission. C-9

C. Protection of Wetlands: Identify any portion of the proposed Project area that should be evaluated for wetlands or United States waters delineation by the United States Army Corps of Engineers (USACE), or requires a permit from the USACE, and identify the status of coordination with the USACE. C-10

D. Compliance with the Farmland Protection Policy Act: Identify whether the Project will result in the conversion of farmland. State the status of farmland (Prime, Unique, or Local and Statewide Importance) in the Project area and determine if this area is under a Williamson Act Contract. C-11

E. Compliance with the Migratory Bird Treaty Act: List any birds protected under this act that may be impacted by the Project and identify conservation measures to minimize impacts. C-12

F. Compliance with the Flood Plain Management Act: Identify whether or not the Project is in a Flood Management Zone and include a copy of the Federal Emergency Management Agency flood zone maps for the area. C-13

G. Compliance with the Wild and Scenic Rivers Act: Identify whether or not any Wild and Scenic Rivers would be potentially impacted by the Project and include conservation measures to minimize such impacts. C-14

Following the preparation of the draft CEQA document for the Project, please provide us a copy of the document to review if the Agency is considering CWSRF financing. In addition, we would appreciate notices of any hearings or meetings held regarding environmental review for the Project. C-15

Thank you for the providing us a copy of your NOP, and the consideration of the CWSRF for the financing of the Agency's Project. If you have any questions or concerns, please feel free to contact me at (916) 341-5855, or by email at AKashkoli@waterboards.ca.gov, or contact Christopher Bruni at (916) 341-5799, or by email at CBruni@waterboards.ca.gov.

Sincerely,

Madeline Harlan for

Ahmad Kashkoli
Senior Environmental Scientist

1. SRF & CEQA-Plus
2. Quick Reference Guide to CEQA Requirements for State Revolving Fund Loans
3. Instructions and Guidance for "Environmental Compliance Information"
4. Basic Criteria for Cultural Resources Reports

Letter C (cont)

cc: State Clearinghouse
(Re: SCH# 2013051094)
P.O. Box 3044
Sacramento, CA 95812-3044

Letter C (cont)

If project emissions are **below the "de minimis" levels** and less than 10% of the emissions inventory for the non-attainment or maintenance area, then:

- **Further general conformity analysis is not required.**

If project emissions are **above the "de minimis" levels**:

- **A conformity determination for the area must be made.**

A conformity determination can be made if facilities are sized to meet the needs of current population projections used in an **approved** State Implementation Plan (SIP) for air quality. Using population projections, applicants must **quantify** their description of how the proposed capacity increase was calculated.

## NATIONAL HISTORIC PRESERVATION ACT

Section 106 of the NHPA requires federal agencies to take into account effects on historic properties caused by federal actions (such as funding SRF projects) and to provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on such undertakings through consultation with the State Historic Preservation Officer (SHPO) and with interested Indian Tribes and individuals.

***USEPA has delegated to the State Water Board the responsibility for carrying out the requirements of Section 106 of the NHPA.**

**Historic properties include:**

- Archaeological sites.
- Historic era buildings.
- Traditional cultural properties.

**Starting point for the 106 process:**
Applicant's record search and cultural resource documents prepared for CEQA.

**State Water Board's Cultural Resource Officer (CRO) requires:**

- Copies of all original maps and studies for consultation with SHPO.

If your project has the potential to affect historic properties the consultation process can be quite lengthy. **Please contact the CRO early in your planning process to discuss what additional information may be needed for your specific project.**

***Environmental Review Process Guidelines for State Revolving Fund Loan Applicants*** document provides additional information on the review process and can be found on the State Water Board's web site located at:

http://www.waterboards.ca.gov/funding/srf.html

Water Boards

# SRF & CEQA-PLUS

**Environmental Review for State Revolving Fund (SRF) Loan Applicants**

**- WHAT - WHY - HOW -**

State Water Resources Control Board
Division of Financial Assistance
November 2005

## WHAT IS CEQA-PLUS?

The SRF Loan Program is partially funded by the U.S. Environmental Protection Agency (USEPA) and subject to federal environmental regulations, including the Endangered Species Act (ESA), the National Historic Preservation Act (NHPA), and the General Conformity Rule for the Clean Air Act (CAA), among others. Federal agencies have their own policies on how they comply with federal environmental laws. Instead of the National Environmental Policy Act (NEPA), USEPA has chosen to use the California Environmental Quality Act (CEQA) as the compliance base for California's SRF Loan Program, in addition to compliance with ESA, NHPA and CAA. Collectively, the State Water Board calls these requirements **CEQA-Plus.** Additional federal regulations also may apply.

**Lead Agency:** The Applicant

**Duties:**

- Prepare, circulate and consider the environmental documents prior to approving the project.
- Provide the State Water Board with eight (8) copies of the applicant's CEQA documents.

**Responsible Agency:** State Water Board, Division of Financial Assistance

**Duties:**

- Acting on behalf of USEPA, review and consider the CEQA documents before approving the project's funding.
- Make findings as to the adequacy of the documents and require additional studies or documentation, as needed.
- Distribute the applicant's CEQA documents to selected federal agencies for review and comment before making a determination on adequacy. (This distribution is in addition to the standard State Clearinghouse distribution under CEQA.)

***The applicant must address all comments by federal agencies before funding is approved.**

## ENDANGERED SPECIES ACT

**Non-federal Representative** (for all wastewater and water reclamation projects in California that involve an SRF loan): State Water Board

State Water Board - Environmental Services Staff (ES) reviews SRF projects to determine potential effects on federally listed species.

**Applicant Duties:**

- At the earliest possible date, provide ES with:
  - **Species lists.**
  - **Biological assessments.**
  - **Other documents related to project effects on sensitive species.**
- Notify ES **early** during the planning process of any issues regarding sensitive species.

**ES Duties:**

- Confer informally with the U.S. Fish and Wildlife Service (USFWS) and/or National Marine Fisheries Service (NMFS), as necessary.
- Evaluate and inform USFWS/NMFS of project impacts to federally listed species.
- Ask USEPA to request formal consultation if ES, in conjunction with USFWS/NMFS, determines that a project will adversely affect a federally listed species.

***USEPA will act as the lead agency in the formal consultation process. In response to a formal request from USEPA, USFWS/NMFS may have up to 90 days to prepare a biological opinion. The process can last 135 days or longer.**

## CLEAN AIR ACT

**CAA general conformity analysis applies only to projects in areas:**

- Not meeting National Ambient Air Quality Standards (NAAQS).
- Subject to a maintenance plan.

An analysis is necessary for each **criteria pollutant below** for which an area is considered as being in nonattainment or maintenance:

- **ozone**
- **carbon monoxide**
- **nitrogen dioxide**
- **sulfur dioxide**
- **lead**
- **inhalable particulate matter**

Letter C (cont)

## Cultural Resources

*Compliance with*
*Federal Section 106 of the*
*National Historic Preservation Act*

**Information Needed from the Applicant:**

- Current records search with maps showing all sites and surveys drawn in relation to the project area.
- Native American consultation.
- Instructions as to how to get started are found in the CEQA Guidelines, since these two items are basic to any cultural resources review.

## Migratory Bird Treaty Act

**Information Needed From the Applicant:**

- Identification of whether or not the project is within jurisdiction of the Migratory Bird Treaty Act.

## Wild and Scenic Rivers Act

**Information Needed from the Applicant:**

- Identification of whether or not the project will impact any Wild and Scenic Rivers.

## Other Requirements

**Information Needed from the Applicant:**

- Eight (8) copies of the final CEQA document.
- A date-stamped copy of the Notice of Determination or the Notice of Exemption filed with the Governor's Office of Planning and Research and a receipt of the filling fees paid to the California Department of Fish and Game for Negative Declarations (ND) or Environmental Impact Reports (EIR).
- A copy of the Resolution from the lead agency, approving or certifying the CEQA document and their project. *Note: The CEQA Guidelines uses "approve" or "adopt" for ND and "certify" for EIR.*

# Quick Reference Guide to the California Environmental Quality Act (CEQA)-Plus Requirements for State Revolving Fund Loans

*Guide to Federal Requirements*

State Water Resources Control Board
Division of Financial Assistance
January 2008

## Endangered Species

*Compliance with Section 7 of the Endangered Species Act*

Information Needed from the Applicant:

- List of special status species (both animal and plant) likely or possibly to occur at project site. *Note: If none will possibly occur, provide supporting information.*
- Any biological assessments or special biological studies that may have been done for the project.
- Other documents that disclose information about the project's effect on sensitive species.

## Protection of Wetlands

Information Needed from the Applicant:

- Identification of whether or not the project or construction activities will impact streams, flood control channels, or wetlands.

## Air Quality

*Compliance with the Federal Air Quality Act*

Information Needed from the Applicant:

- Air quality studies that may have been done for the project.
- For those projects in non-attainment areas or attainment areas subject to maintenance plans:
  - → Emission data for each criteria pollutant for which the area has been designated non-attainment or maintenance; and
  - → Summary of the emissions that are expected from both the construction and operation of the project for each criteria pollutant in a non-attainment or maintenance area.
- If emissions are above the federal de minimis levels, but the project is sized to meet only the needs of current population projections that are used in the approved State Implementation Plan for air quality:
  - → Quantitatively indicate how the proposed capacity increase was calculated using population projections.

## Floodplain Management

Information Needed from the Applicant:

- Identification of whether or not the project is in a Flood Management Zone and a copy of the Federal Emergency Management Agency flood zone maps for the project area.

## Farmland Protection Policy Act

Information Needed from the Applicant:

- Identification of whether or not the proposed project will impact any important farmland or land under Williamson Act control.

## Coastal Zone Management Act

Information Needed from the Applicant:

- Identification of whether or not the proposed project is in the Coastal Zone.

# BASIC CRITERIA FOR CULTURAL RESOURCES REPORTS

## FOR SECTION 106 CONSULTATION WITH THE STATE HISTORIC PRESERVATION OFFICER (SHPO) UNDER THE NATIONAL HISTORIC PRESERVATION ACT (NHPA)

CULTURAL RESOURCES REPORTS
The Section 106 compliance efforts and reports must be prepared by a qualified researcher that meets the Secretary of the Interior's Professional Qualifications Standards (www.cr.nps.gov/local-law/arch_stnds_9.htm).

REPORT TERMINOLOGY
A cultural resources report used for Section 106 consultation should use terminology consistent with 36 CFR, Section 800.16 of the NHPA. This doesn't mean that the report needs to "filled" with passages and interpretations of the regulations, the SHPO reviewer already knows the law.

- If "findings" are made they must be one of the four "findings" listed in Section 106. These include:

  "No historic properties affected" (no properties are within the APE, including the below ground APE).

  "No effect to historic properties" (properties may be near the APE but the project will not impact them).

  "No adverse effect to historic properties" (the project may affect historic properties but the impacts will not be adverse)

  "Adverse effect to historic properties". *Note: the SHPO must be consulted at this point. If your consultant proceeds on his own, his efforts may be wasted.*

CURRENT RECORDS SEARCH INFORMATION
- A current (less than a year old) records search from the appropriate Information Center is necessary. The records search should include maps that show all recorded sites and surveys in relation to the area of potential effects (APE) for the project.

- The APE is three-dimensional and includes all areas that may be affected by the project. It includes the surface area and extends below ground to the depth of any project excavations.

- The records search request should be made for an area larger than the APE. The appropriate area varies for different projects but should be drawn large enough to provide information on what types of sites may exist in the vicinity.

NATIVE AMERICAN AND INTERESTED PARTY CONSULTATION

- Native American and interested party consultation should be initiated at the beginning of any cultural resource investigations. The purpose is to gather information from people with local knowledge that may be used to guide research.

- A project description and map should be sent to the Native American Heritage Commission (NAHC) requesting a check of their Sacred Lands Files. The Sacred Lands Files include religious and cultural places that are not recorded at the information centers.

- The NAHC will include a list of Native American groups and individuals with their response. A project description and maps should be sent to everyone on the list asking for information on the project area.

- Similar letters should be sent to local historical organizations.

- Follow-up contact should be made by phone if possible and a phone log should be included in the report.

WARNING PHRASES IN ALREADY PREPARED CEQA REPORTS

- A finding of **"no known resources"**, this doesn't mean anything. The consultant's job is to find out if there are resources within the APE or to explain why they are not present.

- **"The area is sensitive for buried archaeological resources",** followed by a statement that **"monitoring is recommended as mitigation".** Monitoring is not an acceptable mitigation. A reasonable effort should be made to find out if buried resources are present in the APE.

- **"The area is already disturbed by previous construction",** this may be true, but documentation is still needed to show that the new project will not affect cultural resources. As an example, an existing road can be protecting a buried archaeological site. Or, previous construction may have impacted an archaeological site that was never documented.

- No mention of **"Section 106"**, a report that gives adequate information for CEQA may not be sufficient to comply with Section 106.

SHPO CONSULTATION LETTER

- A Section 106 consultation letter should be prepared by a qualified researcher, and submitted along with the Section 106 Report to the State Water Board to use to consultant with the State Historic Preservation Officer.

STATE WATER BOARD CONTACT INFORAMTION

Please contact Mr. Ahmad Kashkoli 916-341-5855 or akashkoli@waterboards.ca.gov if you have any questions related to CWSRF Program cultural resources compliance.

**Letter C (cont)**

Introduction:

The State Water Resources Control Board (State Water Board) uses the California Environmental Quality Act (CEQA) review process and compliance with federal environmental laws and regulations to satisfy the environmental requirements of the Clean Water State Revolving Fund (CWSRF) Program Operating Agreement between the United States Environmental Protection Agency (USEPA) and the State Water Board. The CWSRF Program is partially funded by a capitalization grant from the USEPA. The issuance of funds from the CWSRF Program is equivalent to a federal action, and thus, compliance with federal environmental laws and regulations is required for projects being funded under the CWSRF Program.

All CWSRF Program applicants must submit adequate and complete environmental documentation to the State Water Board. Following submittal of an applicant's environmental documents, the State Water Board will review the documents to determine if the information is sufficient to document compliance with the CWSRF Program environmental requirements, including making a determination if consultation with federal authorities is required, and may request additional environmental information, when needed. The State Water Board encourages all applicants to initiate early consultation, so that the State Water Board can better streamline the environmental review process.

CEQA Information:

All projects coming to the State Water Board for funding are considered "projects" under CEQA because of the State Water Board's discretionary decision to approve funding.

Detailed information, including CEQA statutes and guidelines can be found online at the California Natural Resources Agency website at http://ceres.ca.gov/ceqa. A CEQA Process Flowchart that shows interaction points between lead and responsible agencies can be found at http://ceres.ca.gov/topic/env_law/ceqa/flowchart/index.html. In addition, State Water Board environmental staff is available to answer questions about the CEQA process, as well as the CWSRF Program environmental requirements. Please contact your assigned Project Manager at the State Water Board, regarding contact information for the appropriate environmental staff.

CEQA requires full disclosure of all aspects of the project, including impacts and mitigation measures that are not only regulated by state agencies, but also by federal agencies. Early consultation with state and federal agencies in the CEQA process will assist in minimizing changes to the project when funding is being requested from the State Water Board.

The types of CEQA documents that may apply to an applicant's project include one or a combination of the following: 1) Notice of Exemption (NOE); 2) Initial Study and Negative Declaration (ND); 3) Initial Study and Mitigated Negative Declaration (MND) with a Mitigation Monitoring and Reporting Program (MMRP); 4) Environmental Impact Report (EIR) with an MMRP; and/or 5) Addendum, Supplemental and Subsequent ND, MND or EIR. The applicant must determine the appropriate document for its project and submit the supporting information listed under the applicable section of the Environmental Package Checklist for Applicant (Attachment 1), along with a completed copy of the Evaluation Form for Environmental Review and Federal Coordination (Attachment 2). Please submit two copies of all CEQA documents.

**Letter C (cont)**

The applicant must ensure the CEQA document is specific to the project for which funding is being requested. Program or Master Plan EIRs may not be suitable for satisfying the State Water Board environmental requirements if these documents are not project-specific. When an applicant uses an Addendum, Supplemental or Subsequent CEQA document for a project, the associated Program or Master Plan EIR must also be submitted, especially if the Addendum, Supplemental or Subsequent CEQA document includes references to pertinent environmental and mitigation information contained in the Program or Master Plan EIR.

If the applicant is using a CEQA document that is older than five years, the applicant must re-evaluate environmental and project conditions, and develop and submit an updated environmental document (such as an Addendum, Supplemental or Subsequent CEQA document) based on the results of that re-evaluation. The updated environmental document must be circulated through the State Clearinghouse for public review. The applicant must adopt the final updated environmental document, including any new identified measures, make CEQA findings, and file a Notice of Determination (NOD) with the local county clerk(s) and the Governor's Office of Planning and Research, State Clearinghouse (State Clearinghouse).

Each applicant, if it is a public agency, is responsible for approving the CEQA documents it uses regardless of whether or not it is a lead agency under CEQA. Non-profit organizations shall only be responsible for approving and ensuring implementation of the applicable project mitigation measures identified in the MMRP. All public agencies applying for CWSRF Program funding shall file either an NOE or an NOD with the State Clearinghouse and the local county clerk(s). Date stamped copies of those notices must be submitted with all the applicable environmental documents.

If the CEQA document was jointly prepared by a federal public governmental agency to satisfy the National Environmental Policy Act (NEPA) requirements, then the applicant must submit the corresponding NEPA documents, including a Finding of No Significant Impact, or a Record of Decision completed by the federal NEPA lead agency.

Federal Information:

In addition to CEQA compliance, the State Water Board is required to document environmental compliance with federal environmental laws and regulations, including:

1. Federal Endangered Species Act (ESA), Section 7:

The United States Department of the Interior, Fish and Wildlife Service (USFWS) and the United States Department of Commerce National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) must be consulted for any project that will have the potential to adversely impact a federal special-status species. The USEPA delegated the State Water Board to act as the non-federal lead for initiating informal Section 7 ESA consultation with the USFWS. The State Water Board will coordinate with the USEPA for projects requiring formal Section 7 ESA consultation with the USFWS and projects that will impact federal special-status fish species under the NMFS jurisdiction. The USFWS and NMFS must provide written concurrence prior to a CWSRF financing agreement. USFWS and NMFS comments may include conservation measures, for which the applicant's CWSRF financing agreement will be conditioned to ensure compliance.

For further information on the federal ESA law, regulation, policy, and notices, go to http://www.fws.gov/endangered/laws-policies/index.html and http://www.nmfs.noaa.gov/pr/laws/esa/. Note that compliance with both the state and federal ESAs is required of projects having the potential to impact state and federal special-status species. Although overlap exists between the state and federal ESAs, there might be additional or more restrictive state requirements. For further information on the state ESA, refer to the California Department of Fish and Game website at http://www.dfg.ca.gov/habcon/cesa/.

**Letter C (cont)**

2. Magnuson-Stevens Fishery Conservation and Management Act, Essential Fish Habitat (EFH):

The Magnuson-Stevens Fishery Conservation and Management Act, as amended, is designed to manage and conserve national fishery resources. EFH consultations are only required for actions that may adversely effect EFH. The applicant needs to determine whether the proposed project may adversely affect EFH. NMFS is responsible for publishing maps and other information on the locations of designated EFH, and can provide information on ways to promote conservation of EFHs to facilitate this assessment. If a project may adversely affect a designated EFH, the applicant must complete an EFH consultation.

The State Water Board will coordinate with the USEPA to request an EFH consultation from the NMFS. NMFS is required to respond informally or in writing. NMFS comments may include conservation measures, for which the applicant's CWSRF financing agreement will be conditioned to ensure compliance. For more information, see the brochure at http://www.nmfs.noaa.gov/sfa/reg_svcs/Council%20stuff/council%20orientation/2007/2007TrainingCD/TabT-EFH/EFH_CH_Handout_Final_3107.pdf.

3. National Historic Preservation Act (NHPA), Section 106:

The NHPA focuses on federal compliance. Section 106 requires Federal agencies to take into account the effects of their undertakings on historic properties. The Section 106 process seeks to accommodate historic preservation concerns with the needs of Federal undertakings through consultation among the agency official and other parties with an interest in the effects of the undertaking on historic properties. The goal of consultation is to identify historic properties potentially affected by the undertaking, assess its effects and seek ways to avoid, minimize or mitigate any adverse effects on historic properties. The Section 106 compliance efforts and reports must be prepared by a qualified researcher that meets the Secretary of the Interior's Professional Qualifications Standards (www.cr.nps.gov/local-law/arch_stnds_9.htm).

In addition, CEQA requires that impacts to cultural and historic resources be analyzed. The "CEQA and Archeological Resources" section from the Governor's Office of Planning and Research CEQA Technical Advice Series states that the lead agency obtains a current records search from the appropriate California Historical Resources Information System Center. Also, to contact the Native American tribes that are culturally affiliated with a project area from the list obtained from the Native American Heritage Commission (NAHC).

The NAHC can be contacted at:

915 Capitol Mall, Room 364
Sacramento, CA 95814
Tele: (916) 653-4082

4. Clean Air Act:

For CWSRF financed projects, we recommend including a general conformity section in the CEQA documents so that another public review process will not be needed, should a conformity determination be required. The applicant should check with its local air quality management district and review the Air Resources Board California air emissions map for information on the State Implementation Plan. For information on the analysis steps involved in evaluating conformity, please contact the State Water Board environmental staff through the assigned Project Manager.

**Letter C (cont)**

5. Coastal Zone Management Act:

Projects proposing construction in the Coastal Zone will require consultation with either the California Coastal Commission (or the designated local agency with a Local Coastal Program), or the San Francisco Bay Conservation and Development Commission (for projects located in the San Francisco Bay area). The applicant must submit a copy of the approved Coastal Development permit to the State Water Board to satisfy this requirement.

For more information on Coastal Zone Management Act requirements refer to the following agencies websites:

- United States Coastal Zone Boundaries through the NMFS website at http://coastalmanagement.noaa.gov/mystate/docs/StateCZBoundaries.pdf;
- California Coastal Commission website at http://www.coastal.ca.gov/ccatc.html; and/or
- San Francisco Bay Conservation and Development Commission website at http://www.bcdc.ca.gov/.

6. Coastal Barriers Resources Act:

The Coastal Barriers Resources Act is intended to discourage development in the Coastal Barrier Resources System and adjacent wetlands, marshes, estuaries, inlets, and near-shore waters. Since there is no designated Coastal Barrier Resources System in California, no impacts from California projects are expected. However, should the applicant believe there may be impacts to the Coastal Barrier Resources System due to special circumstances, please use the following information as a guide.

During the planning process, the applicant should consult with the appropriate Coastal Zone management agency (e.g., City or County with an approved Local Coastal Program, the California Coastal Commission, or the San Francisco Bay Conservation and Development Commission) to determine if the project will have an effect on the Coastal Barrier Resources System. If the project will have an effect on the Coastal Barrier Resources System, the State Water Board must consult with the appropriate Coastal Zone management agency and the USFWS. Any recommendations from the Coastal Zone management agency and USFWS will be incorporated into the project's design prior to approval of CWSRF financing.

For more information and to ensure that no modifications to Coastal Barrier Resources System have occurred, please visit: http://www.fws.gov/CBRA/.

7. Farmland Protection Policy Act:

Projects involving impacts to farmland designated as prime and unique, local and statewide importance, or under a Williamson Act Contract, will require consultation with the United States Department of Agriculture, Natural Resources Conservation Service and/or California Department of Conservation. For more information on the Farmland Protection Policy Act go to http://www.nrcs.usda.gov/programs/fppa, and regarding the Williamson Act Contact go to http://www.consrv.ca.gov/dlrp/lca.

**Letter C (cont)**

8. Floodplain Management – Executive Order 11988:

Each agency shall take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health and welfare, and to restore and preserve the natural and beneficial values served by floodplains in carrying out its responsibilities. Before taking an action, each agency shall determine whether the proposed action will occur in a designated floodplain. The generally established standard for risk is the flooding level that is expected to occur every 100 years. If an agency determines or proposes to, conduct, support, or allow an action to be located in a floodplain, the agency shall consider alternatives to avoid adverse effects and incompatible development in the floodplains.

For further information regarding Floodplain Management requirements, please consult the United States Department of Homeland Security, Federal Emergency Management Agency website at http://www.fema.gov, as well as the USEPA floodplain management Executive Order 11988 at http://www.epa.gov/owow/wetlands/regs/eo11988.html.

9. Migratory Bird Treaty Act (MBTA):

The MBTA restricts the killing, taking, collecting and selling or purchasing of native bird species or their parts, nests, or eggs. The MBTA, along with subsequent amendments to this act, provides legal protection for almost all breeding bird species occurring in the United States and must be addressed under CEQA. In the CEQA document, each agency must make a finding that a project will comply with the MBTA. For further information, please consult the Migratory Bird Program through the USFWS website at http://www.fws.gov/laws/lawsdigest/migtrea.html.

10. Protection of Wetlands – Executive Order 11990:

Projects, regardless of funding, must get approval for any temporary or permanent disturbance to federal and state waters, wetlands, and vernal pools. The permitting process through the United States Army Corps of Engineers (USACE) can be lengthy, and may ultimately require project alterations to avoid wetlands and waters of the United States. Applicants must consult with the USACE early in the planning process if any portion of the project site contains wetlands, or other federal waters. The USACE Wetland Delineation Manual is available at http://www.wetlands.com/regs/tlpge02e.htm. Also note that the California State Water Boards are involved in providing approvals through the Clean Water Act Section 401 Water Quality Certification Program and/or Waste Discharge Requirements. For more information, please go to http://www.waterboards.ca.gov/water_issues/programs/cwa401/index.shtml.

11. Wild and Scenic Rivers Act:

There are construction restrictions or prohibitions for projects near or in a designated "wild and scenic river." A listing of designated "wild and scenic rivers" can be obtained at http://www.rivers.gov/rivers/california.php. Watershed information can be obtained through the "Watershed Browser" at http://cwp.resources.ca.gov/map_tools.php.

12. Safe Drinking Water Act, Source Water Protection:

Projects must comply with the Safe Drinking Water Act and document whether or not a project has the potential to contaminate a sole source aquifer. For projects impacting a listed sole source aquifer, the applicant must identify an alternative project location, or develop adequate mitigating measures in consultation with the USEPA. For more information, please go to the Sole Source Aquifer Program website at http://epa.gov/region09/water/groundwater/ssa.html.

13. Environmental Justice – Executive Order No. 12898:

Identify and address any disproportionately high and adverse human health or environmental effects of the project's activities on minority and low-income populations. USEPA has defined environmental justice as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies."

*Fair Treatment* means that no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative consequences of industrial, governmental, and commercial operations or programs and policies.

*Meaningful Involvement* means that: 1) potentially affected community members have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; 2) the public's contribution can influence the agency's decision; 3) the concerns of all participants involved will be considered in the decision-making process; and 4) the decision-makers seek out and facilitate the involvement of those potentially affected.

The term "environmental justice concern" is used to indicate the actual or potential lack of fair treatment or meaningful involvement of minority, low-income, or indigenous populations, or tribes in the development, implementation, and enforcement of environmental laws, regulations, and policies.

Your project may involve an "environmental justice concern" if the project could:

a) Create new disproportionate impacts on minority, low-income, or indigenous populations;
b) Exacerbate existing disproportionate impacts on minority, low-income, or indigenous populations; or
c) Present opportunities to address existing disproportionate impacts on minority, low-income, or indigenous populations that are addressable through the project.

# ENVIRONMENTAL[1] PACKAGE CHECKLIST
# FOR APPLICANT
## (What to Submit to Project Manager)

**Required for all CWSRF Projects:**

- ❑ **Evaluation Form for Environmental Review and Federal Coordination with the substantiating information** (i.e. USFWS species list/biological assessment, cultural resources documentation, air quality data, flood map etc.)
- ❑ **Project Report, Scope of Work and Map(s)**

**Based on the type of CEQA documents prepared for the project, provide additional information as identified in the following boxes.**

---

If project is covered under a **CEQA Categorical or Statutory Exemption**, submit a copy of the following:

- ❑ **Notice of Exemption** (filed and date stamped by the county clerk and the Governor's Office of Planning and Research)

---

If project is covered under a **Negative Declaration**, submit a copy of the following:

- ❑ **Draft and Final Initial Study/Negative Declaration (IS/ND)**
  - ❑ Comments and Responses to the Draft IS/ND
- ❑ **Resolution approving the CEQA documents**
  - ❑ Adopting the Negative Declaration
  - ❑ Making CEQA Findings
- ❑ **Notice of Determination** (filed and date stamped by the county clerk and the Governor's Office of Planning and Research)

---

If project is covered under a **Mitigated Negative Declaration**, submit a copy of the following:

- ❑ **Draft and Final Initial Study/Mitigated Negative Declaration (IS/MND)**
  - ❑ Comments and Responses to the Draft IS/MND
  - ❑ Mitigation Monitoring and Reporting Plan/Program (MMRP)
- ❑ **Resolution approving the CEQA documents**
  - ❑ Adopting the Mitigated Negative Declaration and the MMRP
  - ❑ Making CEQA Findings
- ❑ **Notice of Determination** (filed and date stamped by the county clerk and the Governor's Office of Planning and Research)

---

If project is covered under an **Environmental Impact Report (EIR)**, submit a copy of the following:

- ❑ **Draft and Final EIR**
  - ❑ Comments and Responses to the Draft EIR
  - ❑ Mitigation Monitoring and Reporting Plan/Program (MMRP)
- ❑ **Resolution approving the CEQA documents**
  - ❑ Certifying the EIR and adopting the MMRP
  - ❑ Making CEQA Findings
  - ❑ Adopting a Statement of Overriding Considerations for any adverse environmental impact(s), if applicable
- ❑ **Notice of Determination** (filed and date stamped by the county clerk and the Governor's Office of Planning and Research)

If EIR is a joint CEQA/National Environmental Policy Act document (EIR/Environmental Impact Statement or EIR/Environmental Assessment), submit the applicable Record of Decision and/or the Finding of No Significant Impact.

---

[1] If the CEQA document is more than five years old applicant shall provide an updated CEQA document (eg. subsequent, supplemental, or addendum CEQA documents) or a letter that describes the current status of the environmental condition for the project's location.

**Letter C (cont)**

State Water Resources Control Board (State Water Board)
Clean Water State Revolving Fund Program

Evaluation Form for Environmental Review and Federal Coordination

**CWSRF No.:** ______________________________
**Applicant Name:** ______________________________
**Date:** ______________________________
**Project Title:** ______________________________

**1.** **<u>Federal Endangered Species Act (ESA), Section 7</u>:**
**Does the project involve any direct effects from construction activities, or indirect effects such as growth inducement that may affect federally listed threatened or endangered species or their critical habitat that are known, or have a potential, to occur on-site, in the surrounding area, or in the service area?**

a. **Required documents: Attach project-level biological surveys, evaluations analyzing the project's direct and indirect effects on special-status species, and an up-to-date species list (from the United States Fish and Wildlife Service and the California Natural Diversity Database) for the project area.**

☐ No. Discuss why the project will not impact any federally listed special status species:

______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________

☐ Yes. Provide information on federally listed species that could potentially be affected by this project and any proposed avoidance and compensation measures so that the State Water Board can initiate informal/formal consultation with the applicable federally designated agency. Document any previous ESA consultations that may have occurred for the project. Include any comments below:

______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________
______________________________

**Letter C (cont)**

2. **<u>Magnuson-Stevens Fishery Conservation and Management Act, Essential Fish Habitat</u>: Does the project involve any direct effects from construction activities, or indirect effects such as growth inducement that may adversely affect essential fish habitat?**

☐ No. Discuss why the project will not impact essential fish habitat:

☐ Yes. Provide information on essential fish habitat that could potentially be affected by this project and any proposed avoidance and compensation measures. Document any consultations with the National Marine Fisheries Service that may have occurred for the project. Include any comments below:

3. **<u>National Historic Preservation Act, Section 106</u>: Identify the area of potential effects (APE), including construction, staging areas, and depth of any excavation. (Note: the APE is three dimensional and includes all areas that may be affected by the project, including the surface area and extending below ground to the depth of any project excavations).**

- **Required documents: Cultural Resources Assessment** prepared by a prepared by a qualified researcher that meets the Secretary of the Interior's Professional Qualifications Standards (www.cr.nps.gov/local-law/arch_stnds_9.htm). **Current records search** with maps showing all sites and surveys drawn in relation to the project area, and records of **Native American consultation.** Include any comments below:

4. **Federal Clean Air Act:**

**Identify Air Basin Name** ______________________

**Name of the Local Air District for Project Area:** ______________________

**Is the project subject to a State Implementation Plan (SIP) conformity determination?**

☐ No. The project is in an attainment or unclassified area for all federal criteria pollutants.

☐ Yes. The project is in a nonattainment area or attainment area subject to maintenance plans for a federal criteria pollutant. Include information to indicate the nonattainment designation (e.g. moderate, serious, severe, or extreme), if applicable. If estimated emissions (below) are above the federal de minimis levels, but the project is sized to meet only the needs of current population projections that are used in the approved SIP for air quality, then quantitatively indicate how the proposed capacity increase was calculated using population projections.

- **If you checked "Yes" above, provide the estimated project construction and operational air emissions (in tons per year) in the chart below, and attach supporting calculations.**
- **Also, attach any air quality studies that may have been done for the project.**

| Pollutant | Federal Status (Attainment, Nonattainment, Maintenance, or Unclassified) | Nonattainment Rates (i.e., moderate, serious, severe, or extreme) | Threshold of Significance for Project Air Basin (if applicable) | Construction Emissions (Tons/Year) | Operation Emissions (Tons/Year) |
|---|---|---|---|---|---|
| Ozone ($O_3$) | | | | | |
| Carbon Monoxide (CO) | | | | | |
| Oxides of Nitrogen ($NO_x$) | | | | | |
| Reactive Organic Gases (ROG) | | | | | |
| Volatile Organic Compounds (VOC) | | | | | |
| Lead (Pb) | | | | | |
| Particulate Matter less than 2.5 microns in diameter ($PM_{2.5}$) | | | | | |
| Particulate Matter less than 10 microns in diameter ($PM_{10}$) | | | | | |
| Sulfur Dioxide ($SO_2$) | | | | | |

5. **Coastal Zone Management Act:**

**Is any portion of the project site located within the coastal zone?**

☐ No. The project is not within the coastal zone.

☐ Yes. Describe the project location with respect to coastal areas and the status of the coastal zone permit, and provide a copy of the coastal zone permit or coastal exemption:

______________________

______________________

______________________

______________________

______________________

______________________

**Letter C (cont)**

6. **<u>Coastal Barriers Resources Act</u>:**
**Will the project impact or be located within or near the Coastal Barrier Resources System or its adjacent wetlands, marshes, estuaries, inlets, and near-shore waters? Note that since there is currently no Coastal Barrier Resources System in California, projects located in California are not expected to impact the Coastal Barrier Resources System in other states. If there is a special circumstance in which the project may impact a Coastal Barrier Resource System, indicate your reasoning below.**

☐ No. The project will not impact or be located within or near the Coastal Barrier Resources System or its adjacent wetlands, marshes, estuaries, inlets, and near-shore waters.

☐ Yes. Describe the project location with respect to the Coastal Barrier Resources System, and the status of any consultation with the appropriate Coastal Zone management agency and the United States Fish and Wildlife Service:

7. **<u>Farmland Protection Policy Act</u>:**
**Is any portion of the project located on important farmland?**

☐ No. The project will not impact farmland.

☐ Yes. Include information on the acreage that would be converted from important farmland to other uses. Indicate if any portion of the project boundaries is under a Williamson Act Contract and specify the amount of acreage affected:

8. **<u>Flood Plain Management</u>:**
**Is any portion of the project located within a 100-year floodplain as depicted on a floodplain map or otherwise designated by the Federal Emergency Management Agency?**

- **Required documents: Attach a floodplain map.**

☐ No. Provide a description of the project location with respect to streams and potential floodplains:

☐ Yes. Describe the floodplain, and include a floodplains/wetlands assessment. Describe any measures and/or project design modifications that would be implemented to minimize or avoid project impacts:

**Letter C (cont)**

9. **Migratory Bird Treaty Act:**
**Will the project affect protected migratory birds that are known, or have a potential, to occur on-site, in the surrounding area, or in the service area?**

☐ No. Provide an explanation below.

☐ Yes. Discuss the impacts (such as noise and vibration impacts, modification of habitat) to migratory birds that may be directly or indirectly affected by the project and mitigation measures to reduce or eliminate these impacts. Include a list of all migratory birds that could occur where the project is located:

10. **Protection of Wetlands:**
**Does any portion of the project boundaries contain areas that should be evaluated for wetland delineation or require a permit from the United States Army Corps of Engineers?**

☐ No. Provide the basis for such a determination:

☐ Yes. Describe the impacts to wetlands, potential wetland areas, and other surface waters, and the avoidance, minimization, and mitigation measures to reduce such impacts. Provide the status of the permit and information on permit requirements:

11. **Wild and Scenic Rivers Act:**
**Identify watershed where the project is located:** ______

**Is any portion of the project located within a wild and scenic river?**

☐ No. The project is not located near a wild and scenic river.

☐ Yes. Identify the wild and scenic river watershed and project location relative to the affected wild and scenic river:

**Letter C (cont)**

12. **Safe Drinking Water Act, Sole Source Aquifer Protection:**
**Is the project located in an area designated by the United States Environmental Protection Agency, Region 9, as a Sole Source Aquifer?**

☐ No. The project is not within the boundaries of a sole source aquifer.

☐ Yes. Contact USEPA, Region 9 staff to consult, and identify the sole source aquifer (e.g., Santa Margarita Aquifer, Scott's Valley, the Fresno County Aquifer, the Campo/Cottonwood Creek Aquifer or the Ocotillo-Coyote Wells Aquifer) that will be impacted:

______________________________

______________________________

13. **Environmental Justice:**
**Does the project involve an activity that is likely to be of particular interest to or have particular impact upon minority, low-income, or indigenous populations, or tribes?**

☐No. Selecting "No" means that this action is not likely to be of any particular interest to or have an impact on these populations or tribes. Explain.

______________________________

______________________________

______________________________

______________________________

______________________________

☐Yes. If you answer yes, please check at least one of the boxes and provide a brief explanation below:

☐ The project is likely to impact the health of these populations.

☐ The project is likely to impact the environmental conditions of these populations.

☐ The project is likely to present an opportunity to address an existing disproportionate impact of these populations.

☐ The project is likely to result in the collection of information or data that could be used to assess potential impacts on the health or environmental conditions of these populations.

☐ The project is likely to affect the availability of information to these populations.

☐ Other reasons, describe: ______________________________

Letter D

**From:** Guidi, Robert G CIV (US) [mailto:robert.g.guidi.civ@mail.mil]
**Sent:** Wednesday, June 19, 2013 12:05 PM
**To:** GWR
**Cc:** Elliott, John H CIV (US); Grover-Bullington, Lenore R CIV (US); Preciado, Rogelio E CIV (US)
**Subject:** GWR EIR Scoping

Dear Bob,

Thank you for the opportunity to provide input on the Monterey Peninsula GWR EIR. Undoubtedly this proposed project and associated environmental analysis will receive a substantial amount of scrutiny.

Having listened to the various presentations and read the NOP for the EIR here are a few initial comments for consideration during the CEQA public scoping process as follows:

1. Water Quality – MRWPCA and DDA are planning to address the potential environmental impacts thereof. The depth or extent of that analysis is critical because of the safety concerns associated with the proposed technology. People must be highly assured the groundwater pumped out the aquifer is safe for consumption. The effluent from the six sources of recovered water is an initial concern. These sources vary significantly in concentrations and types of contaminates. Once these source waters are pumped and treated at the regional wastewater treatment facility the quality of the product water injected into the Seaside Basin Groundwater Aquifer comes into question (e.g. potential to contaminate the existing groundwater aquifer). Likewise, there are concerns about the quality of the "mixed" groundwater being provided for reuse. Bottom line – this environmental analysis must be thorough and flawless leaving no unanswered questions about safe drinking water. D-1

2. Socio-economic – This proposed project will probably add another water user fee to overburdened business and property owners. The costs of not only this project bit also the cumulative socio-economic impacts of multiple regional water projects need to be analyzed in detail. Various financial impacts, both adverse and beneficial must be explained clearly. The economic ripple effects throughout the communities from water rate increases such as higher costs for goods/services and gains/losses in jobs must be fully analyzed. The estimated range of the per unit costs in AF/yr for this proposed "new" source of water should be assessed against other proven supplemental water supplies and clearly explained to the water rate payers . D-2

3. Biological impacts – Three "barriers" have been identified for the treatment of the groundwater. Other types of barriers such as exposure to high intensity ultra-violet light combined with H2O2 should be addressed. Explaining the environmental reasons for selecting and eliminating alternative technologies provides a better analysis. D-3

Hopefully these initial comments are helpful in the scoping the EIR. Please keep POM DPW informed of any upcoming meetings and the availability of the Draft EIR.

RE: Notice of Preparation: Monterey Peninsula Groundwater Replenishment Project EIR.

Dear Mr. Holden,

Thank you for the opportunity to comment on the Notice of Preparation for the Monterey Peninsula Groundwater Replenishment Project EIR. The California Department of Parks and Recreation owns and operates Fort Ord Dunes State Park (FODSP). In reviewing the NOP, State Parks has concern over the project's product water conveyance facilities that are proposed to be installed within the TAMC Right-Of-Way (ROW). Conveyance facilities within the TAMC ROW may require that construction related activities have access through FODSP. Any such access would require close coordination and approval from State Parks in advance. State Parks requests that staff be included in any conceptual design and or pre-construction meetings that involve the use of FODSP. Should the project require access through FODSP there will need to be close coordination with district and real property staff for the issuance of any needed temporary construction easements. Such easements can take up to 18 months to process. E-1

Other concerns include placing construction equipment on existing park roads and trails that are being used by the public, any associated traffic control needs, and avoiding impacts to park natural resources. E-2

Again, thank you for the opportunity to comment on the Notice of Preparation for the Monterey Peninsula Groundwater Replenishment Project EIR.

Sincerely,

Stephen Bachman
Senior Planner

June 27, 2013

Bob Holden
Monterey Regional Water Pollution Control Agency
#5 Harris Court, Building D
Monterey, California 93940

Transmitted by e-mail to GWR@mrwpca.org

Dear Mr. Holden:

The Coalition of Peninsula Businesses (CPB) submits these comments on the Notice of Preparation (NOP) for the Monterey Groundwater Replenishment Project Environmental Impact Report.

**Purpose of project**

The project description should be more specific as to the purpose of the project; it is variously described as intended to help resist Seaside Basin seawater intrusion, as a source of replenishment water to help Cal Am meet its water needs with other than its illegal pumping of Carmel River Basin water and Seaside Basin water in excess of the water master-determined safe yield limits, and as a means to reduce the desal plant size of Cal Am's Monterey Peninsula Water Supply Project.

The project description needs to be amended to establish a clearer project purpose, explain the project's relationship or inter-relationship with the regional water project pending before the PUC, and to provide a clearer definition of its intended goal. Whether the Groundwater Replenishment Project is intended to be a stand-alone project or as a supplement to Cal Am's project should be spelled out clearly. The NOP seems to be geared to Peninsula water supply replacement only but it is not clear how or when or why that decision was made, if in fact a decision had been made. F-1

**Inter-relationship with the CSIP project**

MRWPCA apparently intends to use or build upon the facilities built for and financed by the landowners in the CSIP area. The rights of those landowners for use of reclaimed water up to the first 19,500 AFY and MRWPCA's right to divert any portion of that reclaimed water to another use must be explained. F-2

**Source water**

Sources of water to be reclaimed clearly must be spelled out, the status of agreements for acquisition and transportation of source water must be disclosed and legal rights to the use the source water and then to distribute recycled water need to be clearly established. The legal dispute between MRWPCA and ag interests as to rights to recycled water and the quantity of recycled water assured to ag interests must be resolved. If necessary, the sources of water to be recycled must be sufficient to meet the assurances to ag interests and provide water for sale to Cal Am for drinking water. F-3

OCEAN & MISSION• SUITE 201• P.O. BOX 223542 • CARMEL, CA • 93922
PHONE: 831-626-8636 • FAX: 831-626-4269 • EMAIL: jrbobmck@gmail.com or badams@adcomm4.com

**Quality of source water**

Rec ditch and other ag sources of water to be recycled are mentioned as possibilities. The Monterey County Water Resources Agency has conducted several studies of the quality of rec ditch and other ag runoff waters and found those waters to be highly polluted and contaminated. The instant EIR should reflect those prior studies and explain in some detail how the pollution and contamination will be dealt with to elevate the recycled water to California Department of Public Health standards. Specific examples of where source water of this quality has been successfully reclaimed to drinking water standards and at what cost should be provided. F-4

**Reliability of the continuing quantity of source water**

Due to highly increased water conservation measures throughout MRWPCA's service area, the amount of inflow has decreased over the last several years. This trend should be projected and the effect on MRWPCA's ability to produce reclaimed wastewater assessed. F-5

The same question should be answered in light of the proposed source water given the increased emphasis on water conservation, recycling and reduction in ag and urban runoff. F-6

**Growth and growth-inducing impacts**

The cities and county areas served by Cal Am already have adopted and EIR-certified General Plans that address growth issues and mitigation measures. The instant EIR should review and reflect those documents. F-7

**Alternatives**

If it is clearly established that the GWR project is intended as a supplement to Cal Am's project or as a Peninsula water supply replenishment-only project, study of a GWR project as an independent source of additional Peninsula water supply must be studied. F-8

Thank you for your attention to our concerns.

Sincerely,

Coalition of Peninsula Businesses

FARM BUREAU MONTEREY

June 28, 2013

Mr. Bob Holden
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

**RE: Scoping for draft EIR on Groundwater Replenishment Project**

Dear Mr. Holden:

Monterey County Farm Bureau represents family farmers and ranchers in the interest of protecting and promoting agriculture throughout our County. We strive to improve the ability of those engaged in production agriculture to provide a reliable supply of food and fiber through responsible stewardship of our local resources.

Our primary concern with the proposed groundwater replenishment program is that of sufficient source water to supply the project in a reliable and effective manner throughout the life of the project. As you are well aware, there is a dispute over how much reclaimed water is available for this project, and it remains the Agricultural community's assertion that additional sources of water must be obtained to satisfy the desired annual acre feet of reclaimed water for this project. Our contention is that all the water that is currently committed to the Castroville Seawater Intrusion Project and Marina Coast Water District is not available for use within the scope of this project. G-1

Until this issue is settled to the satisfactory understanding of the Agricultural community, which we hope will happen through a process that involves all stakeholders and included in the CEQA process, we reserve our support for this project.

While we understand that groundwater replenishment is an important part of managing a groundwater basin intruded by saltwater, there must be a clear understanding of what water rights are used for the project. Successful groundwater replenishment programs, such as in Orange County, prove that the technology and science support the benefits of this type of program. G-2

Monterey County Farm Bureau hopes the CEQA process will identify additional water sources that can be used, and potentially be contracted for, to supply reclaimed water for this program. G-3

Thank you for the opportunity to comment on the scope of this CEQA process.

Sincerely,

Norman C. Groot

Monterey, CA 93940

Subject: NOP for Monterey Peninsula Groundwater Replenishment Project EIR (REF130047)

Dear Mr. Holden;

Thank you for the opportunity to review the NOP for the subject project. The Monterey County land use departments have reviewed the NOP and have the following comments:

Land Use. The EIR should include a consistency analysis with the Monterey County 2010 General Plan, applicable Land Use Plans as well as Titles 20 (Coastal Zoning) and Title 21 (Inland Zoning). The analysis should include a map showing the Coastal Zone boundary as well as the boundaries of the applicable Area Plans and Land Use Plans. The project will require Use Permits and Coastal Development Permits and Monterey County will be a Responsible Agency under CEQA. H-1

Construction Impacts. The project description should identify the location and size of all proposed construction staging areas. The traffic analysis should evaluate any temporary construction impacts due to installation of infrastructure in the public right-of-way. H-2

Biology. If any protected trees are proposed for removal, a Forest Management Plan will be required. Protected trees are identified in the corresponding Area Plans and Land Use Plans. The Forest Management Plan should be prepared by one of the consultants on the County's list (available on the County website). H-3

Alternatives. The alternatives should include alternate locations of the proposed facilities to minimize environmental impacts. In particular, if protected trees are proposed for removal and/or improvements are proposed on 25% slopes (Inland) or 30% (Coastal), alternatives should be considered to minimize tree removals and/or development on steep slopes. H-4

Since Monterey County will be a Responsible Agency, we request that the Administrative Draft EIR be submitted for our review. This would help ensure that the EIR meets the County's requirements when decisions are made on the Use Permits and Coastal Development Permits. H-5

Mr. Holden
June 28, 2013
Page 2

Finally, it is strongly recommended that a Pre-Application meeting on this project be scheduled as soon as possible. This would help to identify any land use issues early in the review process and to allow for the project to adjusted prior to submitting a formal application. Including all of the County land use agencies in the Pre-Application meeting would also help to achieve a more complete application upon formal submittal. If you are interested in a Pre-Application meeting, let me know and I will send you an application form. H-6

Feel free to call me if you have any questions.

Sincerely,

Bob Schubert

Bob Schubert, AICP
Senior Planner

Monterey, CA 93940

**Subject: Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Monterey Peninsula Groundwater Replenishment Project, Monterey County**

Dear Mr. Holden:

The California State Lands Commission (CSLC) staff has reviewed the subject NOP for the Monterey Peninsula Groundwater Replenishment Project (Project), which is being prepared by the Monterey Regional Water Pollution Control Agency (MRWPCA). MRWPCA, as a public agency proposing to carry out a project, is the lead agency under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.). The CSLC is a trustee agency because of its trust responsibility for projects that could directly or indirectly affect sovereign lands, their accompanying Public Trust resources or uses, and the public easement in navigable waters. Additionally, if the Project involves work on sovereign lands, the CSLC will act as a responsible agency. I-1

**CSLC Jurisdiction and Public Trust Lands**

The CSLC has jurisdiction and management authority over all ungranted tidelands, submerged lands, and the beds of navigable lakes and waterways. The CSLC also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions (Pub. Resources Code, §§ 6301, 6306). All tidelands and submerged lands, granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the Common Law Public Trust.

I-2

As general background, the State of California acquired sovereign ownership of all tidelands and submerged lands and beds of navigable lakes and waterways upon its admission to the United States in 1850. The State holds these lands for the benefit of all people of the State for statewide Public Trust purposes, which include but are not limited to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space. On navigable non-tidal waterways, including lakes, the State holds fee ownership of the bed of the waterway landward to the ordinary low water mark and a Public Trust easement landward to the ordinary high water mark, except where the boundary has been fixed by agreement or a court. Such boundaries may not be readily apparent from present day site inspections. I-2 cont

In order to determine the CSLC's leasing interest, if any, in the proposed Project, please provide more detailed maps showing the exact locations of all pipelines or other proposed improvements crossing the Salinas River. In addition, should any deep injection or shallow wells be located within the Salinas River or Monterey Bay, please provide CSLC staff with the exact locations as soon as they are known. I-3

**Project Description**

The MRWPCA proposes to produce and deliver high quality treated water for replenishment of the Seaside Basin to meet the Agency's and California American Water Company's (Cal-Am's) objectives and needs as follows:

- Reduce Water Diversions. Cal-Am has been ordered by the State Water Resources Control Board to reduce its diversions from the Carmel River to 3,376 AFY by 2017. The proposed Project will supply 3,500 AFY of replacement water to Cal-Am and reduce diversions from the Carmel River by the same amount;
- Provide a Cost-Effective Water Source. The Project should be capable of supplying reasonably-priced water;
- Regulatory Compliance. The Project should be capable of complying with water quality regulations intended to protect public health; and
- Additional Objectives. The Project should also assist in preventing seawater intrusion into the Seaside Basin, diversifying Monterey County's water supply portfolio, and provide additional water that could be used for crop irrigation. I-4

From the Project Description, CSLC staff understands that the Project would include the following components:

- Source Water Conveyance Facilities. Diversion and collection facilities, including pipelines and pump stations to convey source water to the new treatment facilities;
- Treatment Facilities. Pretreatment facilities, a new Advanced Water Treatment Plant, and associated facilities at the Regional Treatment Plant site to filter and treat the source water;
- Product Water Conveyance Facilities. Pipelines, pump stations, appurtenant facilities along one of two optional alignments to convey the treated water to the Seaside Basin; and
- Replenishment and Recharge Facilities. Pipelines, deep injection and shallow (vadose zone) wells, and backflush facilities to be located at one or both of two optional recharge site (coastal and inland) within the Seaside Basin Boundaries.

**Environmental Review**

CSLC staff requests that the following potential impacts be analyzed in the EIR.

General Comments

1. Project Description: A thorough and complete Project Description should be included in the EIR in order to facilitate meaningful environmental review of potential impacts, mitigation measures, and alternatives. The Project Description should be as precise as possible in describing the details of all allowable activities (e.g., types of equipment or methods that may be used, maximum area of impact or volume of sediment removed or disturbed, seasonal work windows, locations for material disposal, etc.), as well as the details of the timing and length of activities. Thorough descriptions will facilitate CSLC staff's determination of the extent and locations of its leasing jurisdiction, make for a more robust analysis of the work that may be performed, and minimize the potential for subsequent environmental analysis to be required. I-5

Biological Resources

2. Sensitive Species: The EIR should disclose and analyze all potentially significant effects on sensitive species and habitats in and around the Project area, including special-status wildlife, fish, and plants, and if appropriate, identify feasible mitigation measures to reduce those impacts. The MRWPCA should conduct queries of the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and U.S. Fish and Wildlife Service's (USFWS) Special Status Species Database to identify any special-status plant or wildlife species that may occur in the Project area. The EIR should also include a discussion of the MRWPCA's consultation with CDFW and USFWS, including any recommended mitigation measures and potentially required permits identified by these agencies. I-6

3. Invasive Species: One of the major stressors in California waterways is introduced species. In light of the recent decline of native pelagic organisms and in order to protect at-risk fish species, the EIR should examine if any elements of the Project (e.g., changes in amount and timing of freshwater flow) would favor non-native fisheries within the Salinas River. The CDFW's Invasive Species Program could assist with this analysis as well as with the development of appropriate mitigation (information at http://www.dfg.ca.gov/invasives/) I-7

4. Construction Noise: The EIR should also evaluate noise and vibration impacts on fish and birds from directional drilling of the pipelines and for associated land-side activity. Mitigation measures could include species-specific work windows as defined by CDFW, USFWS, and the National Oceanic and Atmospheric Administration's Fisheries Service (NOAA Fisheries). Again, staff recommends early consultation with these agencies to minimize the impacts of the Project on sensitive species. I-8

5. Frac-Out: If directional drilling will occur under the Salinas River to lay a pipeline, the EIR should evaluate the potential for frac-out to occur during drilling and analyze the potential impacts of frac-out to biological resources, including sensitive species and habitats. If impacts are found to be significant, the EIR should identify feasible mitigation measures to reduce the impacts of frac-out. CSLC staff may request documentation of mitigation for frac-out before issuing a lease. An example of a frac-out contingency plan that generally meets the CSLC's leasing requirements is the Contingency and Resource Protection Plan developed for the Construction of the AT&T Fiber Optic Cable Installation Project, Las Vegas to Victorville FTB Clark County, Nevada, and San Bernardino Counties, which is available at http://www.slc.ca.gov/division_pages/DEPM/DEPM_Programs_and_Reports/ATT_Fiber_Optic/PDF/Appendices/Ap-I_HDD_Plan.pdf. I-9

Climate Change

6. Greenhouse Gases: A greenhouse gas (GHG) emissions analysis consistent with the California Global Warming Solutions Act (AB 32) and required by the State CEQA Guidelines[1] should be included in the EIR. This analysis should identify a threshold for significance for GHG emissions, calculate the level of GHGs that will be emitted as a result of construction and ultimate build-out of the Project, determine the significance of the impacts of those emissions, and, if impacts are significant, identify mitigation measures that would reduce them to less than significant. I-10

7. Sea Level Rise: The EIR should also consider the effects of sea level rise on all resource categories potentially affected by the proposed Project. One of the Project's objectives is to prevent saltwater intrusion into groundwater basins. Since the EIR's impacts analysis will be used to develop a range of alternatives to the Project, please consider how sea level rise may increase or accelerate saltwater intrusion into the Project's groundwater basins and determine the Project's resiliency to sea level rise. If sea level rise is found to reduce the Project's effectiveness and impact CEQA resource categories, consider creating an alternative to the Project that would be more resilient to sea level rise. I-11

   At its meeting on December 17, 2009, the CSLC approved the recommendations made in a previously requested staff report, "A Report on Sea Level Rise Preparedness" (Report), which assessed the degree to which the CSLC's grantees and lessees have considered the eventual effects of sea level rise on facilities located within the CSLC's jurisdiction. (The Report can be found on the CSLC's website, www.slc.ca.gov.) One of the Report's recommendations directs CSLC staff to consider the effects of sea level rise on hydrology, soils, geology, transportation, recreation, and other resource categories in all environmental determinations associated with CSLC leases.

---

[1] The State "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Please note that, when considering lease applications, CSLC staff is directed to (1) request information from applicants concerning the potential effects of sea level rise on their proposed projects, (2) if applicable, require applicants to indicate how they plan to address sea level rise and what adaptation strategies are planned during the projected life of their projects, and (3) where appropriate, recommend project modifications that would eliminate or reduce potentially adverse impacts from sea level rise, including adverse impacts on public access. I-11 cont

Cultural Resources

8. Submerged Resources: The EIR should evaluate potential impacts to submerged cultural resources in the Project area, including the Salinas River. The CSLC maintains a shipwrecks database that can assist with this analysis. CSLC staff requests that the MRWPCA contact Senior Staff Counsel Pam Griggs (see contact information below) to obtain shipwrecks data from the database and CSLC records for the Project site. The database includes known and potential vessels located on the State's tide and submerged lands; however, the locations of many shipwrecks remain unknown. Please note that any submerged archaeological site or submerged historic resource that has remained in State waters for more than 50 years is presumed to be significant. I-12

9. Title to Resources: The EIR should also mention that the title to all abandoned shipwrecks, archaeological sites, and historic or cultural resources on or in the tide and submerged lands of California is vested in the State and under the jurisdiction of the CSLC. CSLC staff requests that the MRWPCA consult with Senior Staff Counsel Pam Griggs (see contact information below), should any cultural resources on state lands be discovered during construction of the proposed Project. I-13

Additional Review

10. Deferred Mitigation: In order to avoid the improper deferral of mitigation, mitigation measures should either be presented as specific, feasible, enforceable obligations, or should be presented as formulas containing "performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way" (State CEQA Guidelines, §15126.4, subd. (b)). I-14

Thank you for the opportunity to comment on the NOP for the Project. As a responsible agency, the CSLC will need to rely on the Final EIR for the issuance of any amended or new lease as specified above and, therefore, we request that you consider our comments during development of the EIR. Please send additional information on the Project to the CSLC as plans become finalized.

Please send copies of future Project-related documents, including electronic copies of the Draft and Final EIR, Mitigation Monitoring and Reporting Program (MMRP), Notice of Determination (NOD), CEQA Findings and, if applicable, Statement of Overriding Considerations when they become available, and refer questions concerning environmental review to Holly Wyer, Environmental Scientist, at (916) 574-2399 or via e-mail at Holly.Wyer@slc.ca.gov. For questions concerning archaeological or historic resources under CSLC jurisdiction, please contact Senior Staff Counsel Pam Griggs at (916) 574-1854 or via email at Pamela.Griggs@slc.ca.gov. For questions concerning CSLC leasing jurisdiction, please contact Drew Simpkin, Public Land Management Specialist, at (916) 574-2275, or via email at Drew.Simpkin@slc.ca.gov.

Sincerely,

Cy R. Oggins, Chief
Division of Environmental Planning
and Management

**RE: Comments to Notice of Preparation (NOP) for Monterey Peninsula Groundwater Replenishment Project Environmental Impact Report**

Dear Mr. Holden:

The Monterey Regional Waste Management District staff has reviewed the NOP document and found the document to be very well prepared.

We offer one comment adding to the existing language on Page 20, Table 1 as follows: J-1

| Agency/Entity | Permitting Regulation/Approval Requirement |
|---|---|
| Monterey Reg. Waste Management District | Electric Power Purchase Agreement, **Construction, Access, and Right of Way Easements** |

Thank you for the opportunity to review and comment on the NOP.

Very truly yours,

William M. Merry, P.E.
General Manager

## Michael Gonzales

**From:** Mike McCullough [MikeM@mrwpca.com]
**Sent:** Tuesday, July 02, 2013 3:51 PM
**To:** Michael Gonzales; Alison Imamura; Denise Duffy; valerieyoung@rcn.com
**Cc:** Brad Hagemann; Keith Israel
**Subject:** Comments from an individual - Peter Le

July 1, 2013

I have the following comments on the scope and contents of the GWR EIR prepared by MRWPCA:

The EIR needs to analyze thoroughly how the proposed project affects the agreed recycled water capacity of the MCWD in the approximate amount of 2.1 MGD. If MCWD utilizes it full 2.1 MGD recycled water, how much treated water the proposed project can provide.
Similarly, if the farmers insist on their share of 19,500 AFY of recycled water, how does this affect the proposed project? K-1

How does the 3,500 AFY arrive at? The EIR needs to show calculations on this proposed quantity for the existing and future conditions. K-2

The MRWPCA claimed that it has spent about 3 million dollars on modifying the regional treatment plant to provide recycled water to MCWD under the 2009 RUWAP agreement. Will this project utilize the MCWD designs or modified regional treatment that will be paid by MCWD for this project? What additional work on the regional treatment plant that will be done on this project? How does MRWPCA identify and separate all costs for two different projects, MCWD and GWR? K-3

K-4 [What impacts does this proposed project affect the MCWD recycled water project?][What is the required separation between MRWPCA recycled pipes and MCWD recycled pipes?] K-5 K-4/K-5

The EIR needs to consider the alternative of pumping excess winter flow from the Salinas River, treat it, and recharge the Seaside Aquifer.

How do the discharges of the proposed advanced water treatment plant and secondary source water affect the MCWD brine disposal capacity and the total capacity of the existing outfalls? K-6

How does the cooperation between MRWPCA and MCWD involve as described in page 11 of the NOP? K-7

MRWPCA proposes to use the partially MCWD completed recycled water system for this GWR project as described on page 15. Has MRWPCA discussed with any Director or staff on this proposal?
How does this project affect MCWD access to the acquired Armstrong Ranch property?
What is the current residence time of the recharged water as specified by the State? K-8

I would like to ask MRWPCA to make a presentation to the MCWD Board on their expectations of the MCWD roles on this proposed project. K-9

The above comments are mine and they do not represent the official comments from MCWD. Let me know if you have any questions.

Sincerely,

Peter Le

**RE:** Comment Letter for Monterey Regional Water Pollution Control Agency, Monterey Peninsula Groundwater Replenishment Project, Environmental Impact Report, SCH# 2013051094

Dear Mr. Medina:

Thank you for the opportunity to review the Environmental Impact Report, titled Monterey Peninsula Groundwater Replenishment Project. The California Department of Public Health (CDPH), Division of Drinking Water and Environmental Management is responsible for issuing water supply permits administered under the Safe Drinking Water Program. A project triggers a permit if it includes changes to the water supply, storage, treatment of drinking water, or consolidation of one or more public water systems. CDPH will need to issue a new or amended Water Supply Permit for the above referenced project should the project proceed under the alternatives described. CDPH will be a "responsible agency" pursuant to the California Environmental Quality Act (CEQA). L-1

The proposed project would provide a replacement water supply for the California American Water Company's - Monterey District service area and would assist with prevention of seawater intrusion into a coastal aquifer. CDPH would like to provide the following comment in regards to the proposed project: L-2

> The proposed project must comply with any draft or adopted regulations, frequent communication with CDPH is highly recommended to ensure there are no compliance issues.

Please contact Jan Sweigert, CDPH Monterey District Office, at (831) 655-6939 or e-mail Jan.Sweigert@cdph.ca.gov if you have any questions regarding the comments provided. If you have any questions regarding CDPH CEQA permit requirements, please call Jeffery Werth at (916) 449-5285 or e-mail to jeffery.werth@cdph.ca.gov.

Sincerely,

Jeffery Werth

Seaside Basin Watermaster
2600 Garden Road
Suite 228
Monterey, CA 93940

July 1, 2013

Mr. Bob Holden
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

**Subject: Notice of Preparation of Environmental Impact Report for the Monterey Peninsula Groundwater Replenishment Project, May 30, 2013**

Dear Mr. Holden:

The Seaside Basin Watermaster submits the following comments on the Subject document:

1. There are numerous statements in the NOP that the GWR Project will "replenish" the Seaside Groundwater Basin (SGWB). These occur on pages 2, 9, 10, 16, and 17. As noted on page 10, since all of the GWR Project water currently being contemplated for injection into the SGWB will be pumped back out by existing municipal supply extraction wells not long after it has been injected, the GWR Project water will not provide long-term replenishment of the SGWB. The SGWB, as described in the NOP, will simply serve as an interim storage basin for this water. This should be clarified in the EIR. M-1

2. There have been recent discussions with MRWPCA staff regarding the potential for the GWR Project to provide additional water that could truly be beneficial to the SGWB by injecting it and leaving it in the aquifers, rather than pumping it back out. A quantity of 1,000 AFY had been proposed by MRWPCA as recently as May 2013. Apparently the project proponents decided not to include this additional water in the scope of the project for which the NOP was prepared. The Watermaster strongly urges that, if at all possible, the GWR Project be designed and configured such that it could provide additional water to replenish the SGWB. While the Watermaster does not currently have funds that could be used to purchase such additional water, if additional water could be made available once the GWR Project is operational, and if funds to purchase additional water became available, the additional water could be used to help raise groundwater levels to protective elevations to protect the SGWB from seawater intrusion. Accordingly, this potential to provide additional water via future expansion of the GWR Project should be addressed in the EIR. M-2

3. The map in Figure 1 does not clearly show where the GWR Project facilities are located. The "Monterey Peninsula Groundwater Replenishment Area" balloon is so large that it is really not helpful in understanding where the facilities described in the NOP will be located. M-3

4. It is very difficult to see exactly where the proposed Recharge Facilities are located in the map in Figure 2. Two detailed maps with a larger scale, one for each site, would be preferable. M-3 cont

5. On page 7 it states that Cal Am owns 12 wells in the SGWB. It would be more accurate to indicate that Cal-Am *currently operates* 12 production wells in the SGWB. M-4

6. On page 7 the sentence in the third paragraph pertaining to the makeup of the Watermaster should be corrected to read "The Watermaster Board of Directors consists of nine entities, one representative from each:…" The next-to-last sentence in this paragraph should be revised to read "Water levels were found to be below sea level in portions of both…". M-5

7. On page 10 the statement is made that one of the secondary objectives of the project will be to "Assist in preventing seawater intrusion in the Seaside Basin." As noted in Comment No. 1, since all of the GWR Project water will be pumped out after it is injected into the SGWB, it does not appear that the GWR Project, as described in the NOP, will assist in preventing seawater intrusion in the SGWB. This statement should be removed or clarified. M-6

8. A number of water sources for the GWR Project are listed on pages 12-14. Two of the source waters proposed for the GWR Project on pages 12 and 14 are the Blanco Drain and the Reclamation Ditch. Both of these sources have historically shown high levels of contamination, such as a broad spectrum of pesticides, as well as metals and bacterial organisms. The design of the GWR Project Treatment Facilities should address this in order to ensure that the plant is able to reliably produce water of suitable quality for direct injection into the SGWB, which serves as a potable water supply to the public. M-7

9. The first sentence on page 17 should be revised to read "With groundwater levels currently below sea level in portions of both…" M-8

10. Table 1 on page 20 lists a "Permit for Injection/Extraction" that will be needed from the Watermaster. The Watermaster's term for this permit is "Agreement for Storage and Recovery of Non-Native Water from the Seaside Groundwater Basin." The Watermaster adopted a formal process for applicants wishing to obtain such a permit to use, as well as specific requirements the Watermaster will impose if such an agreement were to be prepared for the GWR Project. Details on this can be obtained by contacting the Watermaster's office. M-9

Thank you for the opportunity to submit these comments so they can be addressed in the EIR.

Sincerely,

Robert Jaques

**SUBJECT: Notice of Preparation of Environmental Impact Report for the Monterey Peninsula Groundwater Replenishment Project, May 30, 2013**

Dear Mr. Holden:

At its June 17, 2013 meeting, the Monterey Peninsula Water Management District (MPWMD) Board of Directors reviewed the Notice of Preparation (NOP) for the Monterey Peninsula Groundwater Replenishment (GWR) Project Environmental Impact Report. In addition, MPWMD staff have worked with you during the development of the NOP. As you know, MPWMD is strongly in favor of moving ahead with this EIR and a project that allows 3,500 acre-feet per year (AFY) to be extracted from the Seaside Groundwater Basin (SGB) for municipal use. We have the following comment on the NOP and recommendation for the EIR:

**Water injection and subsequent extraction in the Seaside Groundwater Basin**

Page 17 of the NOP states:

> "It is anticipated that recharge amounts allocated to each well type and target aquifer could readily be adjusted based on basin conditions that will be determined through ongoing monitoring."

MPWMD monitoring of the Santa Margarita aquifer suggests that not all water injected by the GWR Project would be expected to be extracted at existing municipal supply wells completed in the aquifer. While a bypassed portion of injected water may not be "lost" to the aquifer and could eventually help stabilize water levels, it is important that this effect should be better understood with respect to the GWR Project. N-1

MPWMD recommends that the EIR contain an evaluation of both the travel time and volume of water moved between injection and extraction sites in order to determine what portion of injected water can be safely extracted and when. It is possible that in the initial stages of the GWR Project more than 3,500 AFY will need to be injected into the basin in order to provide a net of 3,500 AFY without temporarily or permanently exacerbating the potential for seawater intrusion at extraction sites. An alternative approach could be to develop an operating rule for the basin that would define what period of time must pass between the initiation of injection operations and the N-2

5 Harris Court, Building G, Monterey, CA 93940 • P.O. Box 85, Monterey, CA 93942-0085
831-658-5600 • Fax 831-644-9560 • http://www.mpwmd.dst.ca.us

initiation of extraction operations. In other words, there could be a "buffer" amount of water that is injected into the basin that would increase water levels at extraction sites to a condition that is determined to be "safe" for initiating extraction. N-2 (cont)

I appreciate the work done over the past several years by the Monterey Regional Water Pollution Control Agency to develop this project and look forward to working with you in the future. If you have questions or comments about this letter, please contact me at (831) 658-5650.

Sincerely,

David J. Stoldt, General Manager

CITY OF PACIFIC GROVE
300 Forest Avenue ▫ Pacific Grove, California

July 2, 2013

Monterey Regional Water Pollution Control Agency
ATTN: Bob Holden
5 Harris Court, Bldg D
Monterey, CA 93940

RE: **Comments on Notice of Preparation – Monterey Peninsula Groundwater Replenishment Project Environmental Impact Report (EIR)**

Dear Mr. Holden:

The City of Pacific Grove appreciates the opportunity to comment on the Notice of Preparation for the Groundwater Replenishment Project (GWR) EIR. As a founding member of the Monterey Regional Water Pollution Control Agency (MRWPCA), we are supportive of the Agency's goals to expand recycled water uses to the GWR and reduce or eliminate winter discharges to the Monterey Bay. Pacific Grove has similar goals to maximize recycled water opportunities and eliminate wastewater discharges to the Monterey Bay. O-1

Because of the City's distance from the regional treatment plant, the urban areas between, the nature of the local topography, and the resulting poor cost effectiveness for extending recycled water delivery, MRWPCA has not previously considered opportunity sites within Pacific Grove as feasible to serve recycled water. Therefore, Pacific Grove is independently developing a non-potable recycled water supply project for irrigation of the Pacific Grove Golf Links, El Carmelo Cemetery, and other potential opportunities for recycled water use nearby on the Monterey Peninsula. The Pacific Grove Local Water Project (LWP) includes construction of a new satellite recycled water treatment facility at the existing Point Pinos wastewater treatment plant site to produce an initial 125 acre feet per year. The City plans to reclaim its wastewater from the City's sewage collection system, over which the City has sole control and ownership. O-2

In addition, Pacific Grove faces significant challenges in meeting the State Water Resources Control Board's requirements for discharges to the Pacific Grove Area of Special Biological Significance (ASBS). As previously permitted by MRWPCA and noted in the NOP, the City of Pacific Grove has already constructed portions of a dry weather storm water diversion system in order to meet the ASBS discharge regulations, which prohibit dry weather discharges. The LWP is evaluating the redirection of dry weather storm water flows from its current pumping to the MRWPCA regional treatment plant. O-3

Phone (831) 648-5722 ▫ www.ci.pg.ca.us

We support the NOP statement that MRWPCA member entities could send storm water to the Regional Treatment Plant for use in the GWR Project. In collaboration with the City of Monterey, the City is refining its investigation of alternative means of diverting and potentially treating wet weather storm water flows as part of a compliance project for the ASBS. The ASBS/Stormwater Reuse Project is included within the Monterey Bay Integrated Regional Water Management Plan ("IRWMP") project and has obtained funding through the IRWMP program. These investigations are analyzing the feasibility of options for localized storage at the California American Water-owned David Avenue Reservoir and conveyance of stormwater to the regional treatment plant operated by MRWPCA. Initial modeling of wet weather discharges has identified total flows ranging from 2,500 gallons per minute ("gpm") in an 85th percentile storm event to 12,000 gpm in a 1-year storm event. These flows may be partially diverted to the PGLWP and related facilities, or to MRWPCA as an additional supply source to the GWR. Average annual volumes that could be diverted are still being determined. O-3 (cont)

As MRWPCA moves forward with the GWR, we hope to continue to coordinate our respective efforts and projects. We anticipate the need to further discuss the capacity of the MRWPCA conveyance and treatment systems to be able to accept wet weather storm flows and the total flows from Pacific Grove to serve the GWR Project. The GWR facilities required to convey and inject the additional storm water volume available from the Cities should be addressed in the GWR EIR. These issues are more project-design related yet are likely to also produce environmental effects requiring additional review. The City believes that the GWR Project EIR should also consider the locally proposed projects, particularly in its analysis of cumulative effects. O-4

The GWR Project, particularly if augmented by storm water flows and elimination of discharges to the Monterey Bay, has potential benefits to local MS4 dischargers that should be acknowledged in the Project Objectives. The Seaside Groundwater Basin has adequate storage capacity and need for replenishment that the opportunity to cost effectively incorporate wet weather storm flows should be fully explored and maximized. O-5

Sincerely,

Thomas Frutchey, City Manager
City of Pacific Grove

**Subject: Notice of Preparation of Environmental Impact Report for the Monterey Peninsula Groundwater Replenishment Project, May 30, 2013**

The City of Seaside submits the following comments on the subject document:

1. The project proposes to recharge the Seaside Groundwater Basin with treated water. Could the project scope be expanded to also consider recharging the Carmel River as either as an alternative or as an option? P-1

2. The project proposes to use storm water as a potential water source. On page 13, the NOP states, "Other MRWPCA member entities could also send storm water to the Regional Treatment Plant for use by the GWR Project by adding storm water into existing pipelines, manholes, or pump stations within the MRWPCA wastewater collection system." Does this project propose to revise the MRWPCA NPDES permit to allow storm water to be conveyed and treated by the existing sewer facilities? P-2

3. The Product Water Conveyance Alignment Option 2 (see page 15) would more or less follow Cal-Am's proposed pipeline alignment. Since available space is limited and the installation of two large pipes within the public right of way in the City of Seaside, especially in La Salle Avenue, would be very disruptive, the installation of MRWPCA and Cal-Am facilities should be coordinated to minimize potential impacts. P-3

4. There are numerous statements in the NOP that are very specific as to project design details that may adversely constrain the final project design. For example, on page 16 the NOP states "The GWR Project would include subsurface groundwater recharge facilities, including shallow (or vadose zone) and deep injection wells located at inland and, if feasible, coastal locations within the Seaside Basin." Could this statement be revised to allow some flexibility in the final project design and implementation?

   > "The GWR Project could include subsurface groundwater recharge facilities, including shallow (or vadose zone) and deep injection wells located within the Seaside Basin."

   Another example of modifying the project description to facilitate project implementation is incorporating the following changes on page 17:

   > "*Coastal Recharge Facilities.* The coastal recharge facilities would include up to three deep injection wells and up to four vadose zone wells located east of Highway 1 and west of the Bayonet and Black Horse Golf Course, as shown in Figure 2."

P-4

5. Please clarify which areas and how much land in the City of Seaside are being referred to as the 'Coastal Recharge Facilities' and the 'Inland Recharge Facilities' as shown in Figure 2. P-5

6. The inland recharge facilities location is described on page 17 as "…an acceptable location for the proposed inland recharge facilities, and the location that currently appears to be feasible is a City-planned utility corridor as shown in Figure 2." There is no City-planned utility corridor in the area shown in Figure 2. Please clarify. P-6

7. Please clarify where the 4 deep injection wells noted under the description of Inland Recharge Facilities on Page 17 would be constructed (e.g. area of well containment, back flush pit, fencing, treatment facility, etc.). P-7

8. Provide information related to coordination with the City of Seaside regarding traffic control and construction for the implementation of the underground pipeline within the City of Seaside. P-8

9. On page 17, the following statement under 'Coastal Recharge Facilities' is unclear and should either be removed or clarified. That is, the paragraph is describing the proposed facilities but this statement seems to be trying to discount their value: P-9

   "Due to the shallower water table at the coast, vadose zone wells would be shallower, and the long□term ability of the coastal wells to replenish both the Santa Margarita and Paso Robles aquifers would likely be less than the replenishment ability of the inland wells." P-10

10. On page 17, the following statement about 'available land' within the City of Seaside under 'Coastal Recharge Facilities' is unclear and should clarified. For example, P-11

    "The locations for the proposed coastal recharge facilities were determined based on an analysis of potentially available land and known aquifer characteristics."

11. Table 1, "Potential Permits and Approvals Required" on page 20 should include Seaside Highlands Homeowners Association if some of the land being considered for Coastal Injection Wells is within their jurisdiction. P-12

The City of Seaside appreciates the opportunity to comment on the NOP and looks forward to working with the MRWPCA on the subject project. Please contact the undersigned to discuss any questions or comments.

Sincerely,

Tim O'Halloran

Subject: Comments Regarding the Notice of Preparation – Monterey Peninsula Groundwater Replenishment Project Environmental Impact Report

Dear Mr. Holden:

We have reviewed the subject Notice of Preparation (NOP) and don't have any specific concerns about the NOP but we do have concerns about the process and rationale behind how the Project was defined. Potentially the scope of the Project, should it come to light, needs to be revised. The cornerstone to any adequate environmental review is a clear definition and understanding of the Project. Q-1

Specifically, we have the following questions and concerns. These comments are based upon a general lack of clarity behind the background as to how the Project scope was defined. If the Project scope needs to be revised or clarified, now would be the opportune time to do that before the EIR is prepared:

1. Has MRWPCA considered and quantified all of the potential sources of water flowing into its plant including, but not limited to, dry weather and certain wet weather flows from storm drains? On page 12 of the NOP, storm water collection is mentioned as one of the sources. However, in the subsequent sections of the NOP, the only quantification of flows is related to the City of Salinas Treatment Plant, Blanco drain, the reclamation ditch and storm water flows from the City of Salinas. As for the other member entities non-storm and storm water flows, there is only a passing reference at the bottom of page 13 of the NOP. Q-2

2. If the limitation of 3500 acre-feet per year (AFY) is a function of the source water availability or the capacity of the treatment system, why wasn't a greater capacity considered so that all of the member entities could convey all non-storm/dry weather flows as well as some portion of storm water flows? Q-3

3. How will the ability of member entities to convey non-storm water and storm water flows going to be apportioned? Will enlargements of the conveyance systems need to be made in order to achieve an equitable distribution of the apportionment? Q-4

4. Will there be any consideration for member entities receiving credits for flows that go into the groundwater recharge (GWR) and if so, will there be any quantification of what those credits will be to each entity? Q-5

5. There are certain existing and pending future regulatory reasons to divert both dry and certain wet weather storm drain flows to the MRWPCA Sewage Treatment Plant (STP) and these reasons are based upon removing pollutants from the receiving water (the Monterey Bay). Therefore, have there been any discussions with the State Water Resource Control Board with regard to the potential for discharging filter reject concentrate as described on page 15 of the NOP into the same receiving water that the diversions are intended to protect? Q-6

Please call me at (831) 646-3448 if you require any additional information or clarification on any issues pertaining to these comments.

Sincerely,

Tom Reeves
City Engineer

RE: Comments on the Groundwater Replenishment Project's Notice of Preparation of an Environmental Impact Report

Dear Mr. Holden,

Marina Coast Water District (MCWD, District) is pleased to provide Monterey Regional Water Pollution Control Agency (MRWPCA) with comments to the Notice of Preparation (NOP) for the planned Environmental Impact Report (EIR) associated with the proposed Groundwater Replenishment Project (GWR Project).

In general, MCWD supports the GWR Project. MCWD provides these comments within the NOP's described framework of alternatives, mitigation measures and statutory responsibilities.

The District's comments are:

1) The District encourages incorporating the GWR project into both the Greater Monterey County Integrated Regional Water Management Plan (IRWMP) and the Monterey Peninsula IRWMP. R-1

2) The District encourages MRWPCA to explore alternative source water volumes above the 3,500-acre-feet total specified in the NOP. R-2

3) The District's senior rights to return water from MRWPCA's treatment plant need to be recognized when discussing available plant output. The District is willing to consider leasing a portion of those senior rights for a predetermined period. R-3

Mr. Holden
July 2, 2013
Page 2

4) The District is willing to discuss with MRWPCA potential access to District recycled water (RW) facilities for conveyance of GWR water from the Advanced Water Treatment (AWT) facility to the Seaside Groundwater Basin, with appropriate compensation to the District for that right of access. The District requests the inclusion of this option in the EIR. R-4

5) The District suggests exploring the long term plan (beyond 15-years) for the GWR Project. Will the GWR project continue injecting water into the Seaside Groundwater Basin once the Seaside Groundwater Basin is recharged and is operating within protective groundwater elevations and sustainable yield? Are there other potential uses for Advanced Water Treatment (AWT) water? One future possibility would be to send AWT water northward to combat seawater intrusion in the Salinas Valley Groundwater Basin. R-5

6) The District encourages MRWPCA to evaluate project alternatives that include variable seasonal flow rates of the source waters without the need for including secondary or tertiary effluent water sources. Part of the rationale expressed in the NOP appears to be to obtain and treat enough impaired water to allow the AWT facility to run at a single, predictable flow rate; therefore the seasonality of the water sources appears to be an operational consideration and leads MRWPCA to include effluent water sources in the project. The District would recommend that a project alternative be prepared that uses a treatment facility flow rate model that fluctuates and does not use effluent water sources. R-6

7) The District requests that MRWPCA confirm with the California Department of Public Health (DPH) the required residence time (between injection and extraction) for all the proposed water sources prior to publication of the Draft EIR. R-7

8) MCWD requests confirming that the capacity of the Seaside Groundwater Basin is sufficient, within that pre-determined residence time, for the injection of additional GWR Project water. R-8

9) MCWD requests confirming with DPH, prior to Draft EIR publication, the horizontal distance that will be required between points of injection and points of extraction in the event that those two modes of operation are simultaneously occurring. Will the well spacing requirement and the limited horizontal distance between the proposed coastal recharge facility and the Bay preclude the use of the coastal recharge facility for the GWR? R-9

The District hopes these comments are beneficial and we look forward to working with MRWPCA in advancing regional goals through implementation of the GWR Project.

Sincerely,

Dr. Thomas P. Moore
President, MCWD Board of Directors

Re: Notice of Preparation, Scoping Comments
Monterey Peninsula Groundwater Replenishment Project Environmental Impact Report

July 2, 2013

Dear Bob Holden,

The Fort Ord Community Advisory Group (FOCAG) offers the following comments on the scope of environmental issues. The scope should include existing hazards to drinking water and potential increasing hazards to the drinking water supply due to the migration and leaching of toxic chemicals from former Army training ranges. These would include proposed ground disturbing activities including a horse park. The Seaside Aquifer lies directly beneath the Army Training Ranges, known as Site #39 of former Fort Ord. This area includes the area known as Parker Flats that had, among other uses, Army tank training areas. S-1

Fort Ord is a National Superfund Site, first put on the National Superfund Priority List because of discovered contamination of area groundwater. S-2

Page 2

There have been multiple issues with the Upper 180, the Lower 180, and the 400-foot aquifers beneath areas of former Fort Ord. Site #39, perhaps the largest munitions impact/training area in the country, sits over the Seaside Groundwater Basin. This should be of concern to MRWPCA and others for the possibility of leaching and migration of chemicals into underground aquifers. S-2 cont

It is understood residual munitions chemicals from 77-years of munitions use, remain in Fort Ord training areas, including Site 39. The cleanup thus far, has concentrated on remaining unexploded munitions, but failed to identify many munitions constituents even though numerous munitions chemistry books were and are readily available. How can the extent of contamination be known unless all known munitions constituents are looked for? The cleanup has used a sampling rationale of looking for a few constituents but only reporting levels above a certain threshold. There potentially are hundreds of chemicals below threshold levels. For example, hypothetically, if there are two hundred chemicals each at 2 ppm, well below the reporting level, there potentially could be a toxic chemical brew of 200-400 ppm. Could the cumulative, low levels of chemicals potentially be a health hazard? Are the human health risks known for this level of exposure? What are the synergistic effects of munitions chemicals and pesticides on organisms? Are there studies available on the effects of low-level exposure to these chemicals?

Hundreds of munitions chemicals and pesticides at very low levels may be a potential toxic brew creating a health and safety hazard in the underground water aquifers. The cleanup has failed to make the public aware of the actual levels of munitions and pesticide contaminates throughout training areas.
a) What might be the justification for the cleanup failing to identify all the munitions and pesticide chemicals in Tables 3,4,5, and 6? (See Attachment 2, Tables 1-7). The Army BRAC has been asked the following questions:
b) Because the Army kept abysmal records of training ranges, training areas and specific activities, what is the justification for failing to look for all munitions chemicals and pesticides in all training areas, including Site #39? S-3
c) What is the justification for the cleanup failing to include all the munitions and pesticide chemicals identified in Attachment 2, Tables 3,4,5, and 6?
d) What is the extent of out-gassing from munitions and pesticide chemicals

in former training areas?
e) What is the justification for failing to report the actual levels of munitions and pesticide chemicals in all training areas? S-3 cont

On 3-24-10 (fortordcleanup.com, Document BW-2532), and 2-7-11 (fortordcleanup.com, Document BW-2557), the FOCAG raised questions regarding pesticide use at Fort Ord and in training areas. The 2-7-11 FOCAG letter specifically addresses Army's failure to thoroughly investigate pesticides in training areas. Despite Army's claim that it has thoroughly investigated pesticides in training areas, our review of the cited cleanup documents did not support the Army's claim. The only sampling we have found for pesticides in the Parker Flats and Site 39 training areas was for a total of 4 sample locations that only looked for 8 organochlorine pesticides.

It is our understanding Army BRAC remains responsible for identifying and sampling for chemicals potentially used in training areas, including Site 39. However, the chemicals being looked for in former Army training sites is woefully inadequate. The FOCAG includes, with this letter, 7 Tables of munitions chemicals and pesticides potentially found in former Fort Ord including a list of Training Areas and the chemicals actually being looked for in. (See attachment 2, Tables 1-7) S-4

There are several hundred chemicals potentially leaching out of ordnance into the ground as well as residual chemicals from decades of weapons/ordnance training and pyrotechnics. Herbicides were used to keep vegetation down and minimize threats of wildfires from munitions training exercises. Attached are 6 Tables identifying munitions chemicals and pesticides used in training areas include Table 1, is the Fort Ord Cleanup 1994 list of potential Training Range chemicals. Table 2 is the Fort Ord Cleanup 2003 Sampling and Analysis list of potential Training Range chemicals. Tables 3, and 4 are lists of munitions constituents found in munitions chemistry books, many of which the cleanup has not included in its list(s). Tables 5, and 6 are lists of pesticides; known and suspected as being used at Fort Ord. Particularly alarming is Table 5 that identifies 23 munitions chemicals also known to be pesticides. This may explain why some training areas are virtually devoid of insects and birds. Not only has the cleanup thus far failed to identify all munitions chemicals and pesticides; it has also failed to extensively look for all munitions chemical and pesticides in all training areas. S-4 cont

The FOCAG is not aware of any Basewide training maps pre-1940. We do know the entire pre-1940 Fort Ord footprint was the Gigling Artillery Range 1917-1940. It is understood this artillery range primarily trained with 37mm, 75mm, 105mm, and 155mm projectiles. These projectiles are found throughout most of the pre-1940 footprint. One of the known impact areas for the pre-1940's 37mm and 75mm projectiles is "Artillery Hill". This area, OE-50 and OE-53 (Veterans Cemetery and Endowment Parcels), when sampled and cleared to a depth of 4' discovered significant amounts of 37mm and 75mm fragments and unexploded projectiles. According to the Archives Search Report and interviews with range control personnel, these Sites were target areas for rifle grenades and shoulder launched projectiles in the 1940's, 1950's and 1960's. Other projectiles found include 60mm, 81mm, 3 inch stokes, and 4.2 inch mortars, and Levin's projectors. The latter ground tube launched munitions range(s) was not known prior to the sampling and removal actions. The FOCAG is unaware of historical training maps showing the firing points, range fans, or target areas of any of the ranges within or firing out of Sites OE-50 and OE-53 yet these areas were obviously extensively used for munitions training. S-5

The proposed Veteran's Cemetery site among other uses was a former 1920-30's; 37mm and 75mm artillery target range known as "Artillery Hill". The Veteran's site also includes a Chemical, Biological, Radiological, (CBR) site. Training devices and munitions discovered nearby include non-metallic landmines and Chemical Agent Identification Sets (CAIS) in glass vials. The detection equipment used to clear this site is incapable of detecting non-metallic, and deeply buried munitions. Although the munitions cleanup was to a depth of 4.0', the 37mm has a maximum detection depth of 0.9' and the 75mm has a maximum detection depth of 2.5'. There are other munitions found onsite that cannot be reliably detected within 4' of the surface.

Again, there have been multiple issues with the Upper-180, the Lower-180, and the 400-foot aquifers beneath areas of former Fort Ord. Site 39, perhaps the largest munitions impact/training area in the country, sits over the Seaside Groundwater Basin. This should be of concern to MRWPCA and S-6 others for the possibility of leaching chemicals into underground aquifers. Project Scoping should include:

a) What is the migration and fate of munitions and pesticide chemicals into this drinking water supply?

b) Where did all the chemicals go?

c) What Fort Ord document fully investigated the potential munitions and pesticide contamination?

d) Is there ongoing monitoring and reporting of the potential munitions and pesticide contamination of the Seaside Groundwater Basin? Where is it?

e) What might construction, development, and irrigating in the area above the Seaside Groundwater Basin do for migrating chemicals?

S-6 cont

Thank you for the opportunity to comment on this NOP/Scoping for the EIR for the proposed Monterey Peninsula Groundwater Replenishment Supply.

Respectfully,

Mike Weaver
Co-Chair, FOCAG

# Table 3. Munitions Chemical Compositions

## Explosives, Propellants, Pyrotechnics
### Military Explosives (Chemistry) 30 September 1984

# Explosives

## Chapters 7 & 8

**Lead Azide:** $Pb(N_3)_2$, is a salt of hydrazoic acid, $HN_3$. The compound is white, has a nitrogen content of 28.86 percent and a molecular weight of 291.26. At the melting point, 245°C to 250°C, decomposition into lead and nitrogen gas occurs. The pure compound has two crystal modifications: an orthorhombic form and a monoclinic form. The orthorhombic form, which is also called the alpha form, has a density of 4.68 grams per cubic centimeter and unit cell dimensions of a = 11.31 Angstroms, b = 16.25 Angstroms, and c = 6.63 Angstroms. The monoclinic form, which is also called the beta form, has a density of 4.87 grams per cubic centimeter and unit cell dimensions of a = 18.49 Angstroms, b = 8.84 Angstroms, and c =5.12 Angstroms. The compound is usually prepared as colorless, needlelike crystals.

**Other Lead Azide Types:**

- Dextrinated Lead Azide (DLA)
- Service Lead Azide (SLA)
- Colloidal Lead Azide (CLA)
- Polyvinylalcohol Lead Azide (PVA-LA)
- RD-1333 lead azide
- Dextrinated Colloidal Lead Azide (DCLA)

**Mercury Fulminate** $Hg(ONC)_2$, is a salt of fulminic or paracyanic acid. The acid undergoes polymerization very rapidly in both aqueous and ethereal solutions, and so cannot be isolated. The structure of fulminic acid, and thus the salts of this acid, is undetermined. Mercury fulminate has an oxygen balance to $CO_2$ of-17 percent, an oxygen balance to CO of -5.5 percent, a nitrogen content of 9.85 percent, and a molecular weight of 284.65. When mercury fulminate is crystallized from water, a hydrate, Hg(ON: C).1/2 H20, is formed that has a nitrogen content of 9.55 percent and a molecular weight of 293.64. The anhydrous form, which is crystallized from alcohol, is white when pure but normal manufacturing yields a gray product of only 98 to 99 percent purity. The crystals formed are octahedral but are usually truncated. Only the smaller crystals are fully developed. The crystal density is 4.43 grams per cubic centimeter.

**Diazodinitrophenol (DDNP)** This explosive is also known as 4,5-dinitrobenzene-2-diazo-1-oxide, dinol, diazol and may be referred to as DADNP. The compound is a greenish yellow to brown solid with tabular crystals. DDNP has a crystal density of 1.63 to 1.65 grams per cubic centimeter at 25°C and a molecular weight of 210.108. DDNP is not dead pressed even at a pressure of 896,350 kilopascals (130,000 pounds per square inch).

**Lead Styphnate** Two forms of lead styphnate are used as primary explosives: basic and normal. Basic lead styphnate has a nitrogen content of six percent and a molecular weight of 705.53.

The compound has two crystal forms: yellow needles with a density of 3.878 grams per cubic centimeter and red prisms with a density of 4.059 grams per cubic centimeter. The apparent density is 1.4 to 1.6 grams per cubic centimeter. Normal lead styphnate has a nitrogen content of nine percent and the monohydrate has a molecular weight of 468.38.

**Tetracene** is also known as guanyldiazoguanyl tetrazene and 4-guanyl-1 -(nitrosoaminoguanyl)-1tetrazene. The compound is a colorless to pale yellow, fluffy material with needle crystals, an oxygen balance to $CO_2$ of-57.6 percent, an oxygen balance to CO of-43 percent, a nitrogen content of 74.4 percent, and a molecular weight of 188.15. Tetracene forms a hydrate with three molecules of water. The melting point of the pure compound is between 140°C and 160°C accompanied by decomposition and explosion. The apparent density is only 0.45 grams per cubic centimeter. When compressed at 20,685 kilopascals (3,000 pounds per square inch), the density is 1.05 grams per cubic centimeter. The crystal density is 1.7 grams per cubic centimeter. The compound can be easily dead pressed. Tetracene is practically insoluble in water and ethanol and so can be stored wet with water or a mixture of water and ethanol. The compound is also insoluble in ether, benzene, acetone, carbon tetrachloride, and ethylene dichloride. Tetracene is soluble in dilute nitric acid or strong hydrochloric acid. In a solution with hydrochloric acid, the hydrochloride is precipitated by the addition of ether. Tetracene may then be recovered by treatment with sodium acetate or ammonium hydroxide. The heat of formation is 270 calories per gram and the heat of detonation is 658

**Potassium Dinitrobenzofuroxane (KDNBF)** is a red crystalline solid with a nitrogen content of 21.21 percent and molecular weight of 264.20. The oxygen balance of the compound to $CO_2$, $H_2O$, and $K_2O$ is -42.4 percent. The anhydrous salt has a density of 2.21 grams per cubic centimeter and a melting point, with explosive decomposition, of 210°C. KDNBF is soluble to the extent of 0.245 grams per 100 grams of water at 30°C. Between the temperatures of 50C to 50°C the specific heat is 0.217 calories per gram per degree centigrade. KDNBF is used in primary compositions.

**Lead Mononitroresorcinate (LMNR)** has a nitrogen content of 3.89 percent, an $NO_2$ content of 12.77 percent, a lead content of 57.51 percent, and a molecular weight of 360.30. The compound forms microscopic reddish brown crystals. LMNR has slow burning properties and a low combustion temperature. The compound is used in electric detonators with DLA as the spot charge to initiate a PETN base charge, as an upper charge, and as an ingredient in primary compositions.

**Primary Compositions** are mixtures of primary explosives, fuels, oxidizers, and other ingredients used to initiate detonation in high explosive charges or ignite propellants and pyrotechnics. The ingredients and the portions of the ingredients for individual priming compositions are determined empirically from the use the composition is intended for. Fuels commonly used in priming compositions are lead thiocynate, antimony sulfide, and calcium silicide. The last two also serve to sensitize the composition to friction or percussion. Oxidizing agents include potassium chlorate and barium nitrate. Other ingredients include primary explosives and binders. The major determining factor in ingredient selection is the impetus which is to detonate the priming composition. The types of impetus commonly used are percussion and electrical.

**Percussion Priming Compositions FA959, FA982, FA956, Compounds:**

Normal lead styphnate
Tetracene
Barium nitrate
Antimony sulfide
Powdered zirconium
Lead dioxide
PETN
Aluminum
Gum Arabic

**Stab Detonator Priming Compositions NOL130, PA101, NOL 60, Compounds:**

Lead azide
Basic lead styphnate
Tetracene
Barium nitrate
Antimony sulfide
Powdered aluminum

**Electric Priming Compositions I, II, III, IV, V, VI, Compounds:**

Potassium chlorate
Lead mononitroresorcinate
Nitrocellulose
Lead thiocynate
DDNP
Charcoal
Nitrostarch
Titanium
Aluminum

**Aliphatic Nitrate Esters** compounds in this class are prepared by O-type nitration in which a nitro group is attached to an oxygen atom of the compound being nitrated.

**1,2,4-Butanetriol Trinitrate (BTN)** This explosive is also known as a, b, g-trihydroxybutane trinitrate and is sometimes referred to as BTTN. The compound is a light yellow liquid with a density of 1.520 at 20°C, a molecular weight of 241, a melting point of -27°C, an oxygen balance to CO2 of 17 percent, and a refractive index of 1.4738 at 20°C. The liquid has a viscosity of 62 centipoises at 20°C. 1,2,4- Butanetriol trinitrate is slightly soluble in water, miscible with alcohol, ether, acetone, and a solution of 2 parts ether and 1 part alcohol. BTN has a heat of formation of 368 calories per gram, a heat of combustion of 2,167 calories per gram, and a heat of detonation of 1,458 calories per gram. This compound is a good gelatinizer for nitrocellulose and can be used as a substitute for nitroglycerin in double-base propellants. Heat, vacuum stability, and volatility tests indicate more stability than nitroglycerin. Impact sensitivity is about the same as for nitroglycerin. Brisance, as measured by the sand test, is about the same: 49 grams crushed versus 51.5 grams for nitroglycerin or 47 grams for TNT. The five second explosion temperature is 230°C versus 220°C for nitroglycerin. BTN can be manufactured by the nitration of 1,2,4-butanetriol with a mixture of nitric and sulfuric acids.

**Diethyleneglycol Dinitrate (DEGN)** This explosive is also known as dinitrodiglycol or 2,2'-oxybisethanol dinitrate and is sometimes referred to as DEGDN. The compound is a clear, colorless, odorless liquid with a nitrogen content of 14.29 percent, a theoretical maximum density of 1.39 grams per cubic centimeter, an oxygen balance to C02 of-41 percent, and a molecular weight of 196. DEGN boils between 160° and 161°C and can, upon cooling, form a stable solid with a melting point of 2°C or remain liquid to a freezing point of -11.2° to 11.40°C. Other characteristics of the liquid are: refractive index at 20°C with sodium light, 1.450; viscosity at 20°C, 8.1 centipoises; vapor pressure at 20°C, 0.0036 torr; vapor pressure at 25°C, 0.00593 torr; vapor pressure at 600C, 0.130 torr; specific gravity, 1.385. At 60°C DEGN has a volatility of 0.19 milligrams per square centimeter per hour. At constant pressure, the heat of combustion is 2,792 calories per gram. The heat of formation is-99.4 kilogram calories per mole. The heat of detonation is 1,161 calories per gram. DEGN is readily soluble in ether, acetone, chloroform, benzene, nitrobenzene, toluene, nitroglycerin, and glacial acetic acid but is insoluble in ethanol, carbon tetrachloride, and carbon disulfide. Solubility in water at 25°C and 60°C is 0.40 and 0.46 gram per 100 grams, respectively. DEGN's chemical reactivity is similar to nitroglycerin's, but is less subject to hydrolysis and is not readily saponified by alcoholic sodium hydroxide. DEGN can be used as an explosive and can be used in propellants as a colloiding agent for nitrocellulose. Propellants based on DEGN and nitrocellulose develop relatively low temperatures and cause relatively little erosion of guns, but are unduly volatile.

**Nitrocellulose (NC)** or cellulose nitrate is a mixture of nitrates obtained by nitrating cellulose. Cellulose is a long chain polymer of anhydroglucose units (C5H10O5). The number of anhydroglucose units or degree of polymerization (DP) is variable. Cellulose used for preparation of military grades of nitrocellulose have a DP of approximately 1,000 to 1,500. Cellulose threads possess micellar structure and consist of numerous rod-like crystallites oriented with their long axis parallel to the thread axis, thus forming a fiber. Almost pure cellulose is found in the pith of certain plants, in absorbent cotton, and in some filter papers. Pure cellulose is most readily obtained from cotton by treating with a dilute acid or base solution then thoroughly washing with water. At the present time most of the cellulose for nitrocellulose preparation is obtained from coniferous wood, which is 50 to 60 percent cellulose. Another source is straw, which is 30 to 40 percent cellulose. The nitration of cellulose involves replacement of the hydrogen in the three hydroxyl (OH) groups in the anhydroglucose units with NO2 groups. A representative formula for the nitrated cellulose may be written as C6H7(OH)*x* (ONO2) *y* where *x*+ *y*=3. The mononitrate, *x* =2 and *y* =1, has a nitrogen content of 6.76 percent; the dinitrate, *x*=1 and *y* =2, has a nitrogen content of 11.11 percent; the trinitrate, *x* =0 and *y* =3, has a nitrogen content of 14.14 percent. As a practical matter, however, any desired degree of nitration up to 14.14 percent may be obtained by adjusting the composition of the mixed acid used for nitration, the acid to cellulose ratio, the time of nitration, or the temperature of nitration. In nitrocellulose with less than 14.14 percent nitrogen, the NO2 groups are distributed randomly along the entire length of the cellulose polymer, so *x* and *y* should be regarded as average values over the entire length of the chain. The nitrogen content determines the chemical and physical properties of any particular nitrocellulose. The five grades of nitrocellulose listed below are recognized and used.

**Other Nitrocellulose Types:**

- Pyroxylin or collodion,
- Pyrocellulose
- Guncotton
- High nitrogen nitrocellulose
- Blended nitrocellulose

**Nitroglycerin (NG),** glycerol trinitrate, or 1,2,3-propanetriol trinitrate, is a clear, colorless, odorless, oily liquid with a theoretical maximum density of 1.596 grams per cubic centimeter. Nitroglycerin has a sweet, burning taste and a molecular weight of 227.1. Nitroglycerin is soluble in one liter of water to the extent of only 0.173, 0.191, 0.228, and 0.246 gram at 20°, 30°, 50° and 60°C, respectively and is essentially nonhygroscopic when exposed to atmospheric humidity.

**Nitrostarch (NS)** is a mixture of nitrates obtained by nitrating starch. The general formula for starch is C6H10O5. The structure of starch is the same as for nitrocellulose, with the exception that the polymer chains are spiral rather than straight. The starch molecule consists of approximately 1,000 anhydroglucose units. The nitration of starch involves replacement of the hydrogen in the three hydroxyl (OH) groups in the anhydroglucose units with NO2 groups. A representative formula for the nitrated starch may be written as C6H7(OH) *x* (ONO2)*y* where *x* +*y* =3. The NO2 groups are distributed randomly along the entire length of the starch molecule, so *x* and *y* should be regarded as averages over the entire length of the chain. The following empirical formula can be employed to obtain *y* as a function of the nitrogen content *N*: *y*=162N/(1400-45*N*)

**Pentaerythritol Tetranitrate (PETN)** is also known as 2,2-bis [(nitrooxy) methyl]-1,3-propanediol dinitrate; penthrite; or nitropenta and may be referred to as TEN. The compound is a white solid with a molecular weight of 316.2. PETN has two polymorphs: one with a tetragonal crystalline structure and the other with an orthorhombic crystalline structure. The phase change between the two polymorphs occurs at 130°C. The tetragonal crystals have a density of 1.778 grams per cubic centimeter and the orthorhombic crystals have a density of 1.716 grams per cubic centimeter. Normal manufacturing yields tetragonal crystals. The unit cell dimensions of the tetragonal crystals are a=9.38 Angstroms, b=9.38 Angstroms, and c =6.71 Angstroms. The dimensions for the orthorhombic crystals are a=13.29 Angstroms, b = 13.49 Angstroms, c = 6.83 Angstroms. There are two molecules per cell in the tetragonal form and four molecules per cell in the orthorhombic form. The interatomic distances have been determined as 1.50 Angstroms for the C-C bonds, 1.37 Angstroms for the C-O bonds, 1.36 Angstroms for O-N bonds, and 1.27 Angstroms for N-O bonds. PETN melts at 141.3°C. The boiling point is 160°C under a pressure of 2 torr; 180°C under a pressure of 50 torr. Under atmospheric pressure at temperatures above 21 0°C, PETN decomposes rapidly and in some cases detonates. The vapor pressure of solid PETN can be found by the empirical equation: $\log p = 16.73 - 7750/T$. PETN is more sensitive to initiation than nitrocellulose, RDX, or tetryl, as judged by the sand test. This is shown, also, by the fact that PETN with 35 percent of water present can be detonated by a No. 6 electric blasting cap, whereas RDX fails to explode if more than 14 percent of water is present. PETN is one of the most sensitive of the standardized military explosives.

**Triethylene Glycoldinitrate (TEGN)** This explosive is also referred to as TEGDN. The compound is a light yellow, oily liquid with a nitrogen content of 11.67 percent, a molecular weight of 240.20, and an oxygen balance to $CO_2$ of -66.6 percent. The melting point of the solid is - 19°C. Other characteristics of the liquid are: refractive index, 1.4540; viscosity at 20°C, 13.2 centipoises; vapor pressure at 25°C, less than 0.001 torr; volatility at 60°C, 40 milligrams per square centimeter per hour; and density, 1.335 grams per cubic centimeter. At constant pressure, TEGN's heat of combustion is 3428 calories per gram, heat of explosion is 725 kilocalories per kilogram, and heat of formation is -603.7 kilocalories per kilogram. TEGN is very soluble in acetone, ether, and a solution of 2 parts ether and 1 part ethanol. TEGN is soluble in carbon disulfide and slowly soluble in water. The primary use of TEGN is as a gelatinizing agent for nitrocellulose in propellants, but TEGN can also be used as a component in a liquid explosive, a plasticizer in the fabrication of flexible explosive sheets, and as a plasticizer in pytrotechnic flares.

**1,1,1 Trimethylolethane Trinitrate (TMETN)** This explosive is also known as metriol trinitrate and is sometimes referred to as MTN. The compound is a slightly turbid, viscous oil with a nitrogen content of 16.41 percent and a molecular weight of 255.15. TMETN has a melting point of -3°C and an apparent boiling point of 182°C, but this is merely the temperature at which decomposition becomes vigorous enough to resemble boiling. Other properties of the liquid are a density of 1.47 grams per cubic centimeter at 22°C and a refractive index of 1.4752 at 25°C. TMETN is practically insoluble in water. Less than 0.015 grams dissolved per 100 grams of water at up to 60°C. TMETN is soluble in alcohol and many other organic solvents. At 60°C TMETN's volatility is 24 milligrams per square centimeter. The heat of formation is 422 calories per gram at constant volume and 446 calories per gram at constant pressure. The heat of combustion is 2,642 calories per gram at constant volume with the water being liquid. In an acid bath, TMETN is hydrolyzed to the extent of 0.018 percent in 10 days at 220°C and 0.115 percent in 5 days at 60°C. TMETN can be used as a flash and erosion reducing additive in propellants and an ingredient of commercial explosives. TMETN alone does not gelatinize nitrocellulose unless the temperature is raised to 100°C, which would be dangerous. But if mixed with only 8 percent of metriol triacetate, gelatinization takes place at 80°C. When TMETN is mixed with nitroglycerin, the mechanical properties of double-base cast propellants are improved. Combinations with triethylene glycol dinitrate are used as plasticizers for nitrocellulose.

**Cyclotetramethylenetetranitramine (HMX)** is also known as: octahydro-1,3,5,7-tetranitro-1 ,3,5,7-tetrazocine; 1,3,5,7-tetranitro-1 ,3,5,7-tetrazacyclooctane; cyclotetramethylene tetranitramine; or octogen. HMX is a white, crystalline solid with a nitrogen content of 37.84 percent, a theoretical maximum density of 1.905 grams per cubic centimeter, a nominal density of 1.89 grams per cubic centimeter, a melting point of 285°C, and a molecular weight of 296.17. There are four polymorphs of HMX: an alpha, beta, gamma, and delta form. Each polymorph has a range of stability and there are differences among them in physical properties such as density, solubility, and refractive index. The most common polymorph is the beta form. The term HMX without an alpha, gamma or delta qualifier refers to the beta form throughout the rest of this text. The crystalline structure of beta HMX is monoclinic with a density of 1.903 grams per cubic centimeter. The unit cell dimensions are a=6.54 Angstroms, b=11.05 Angstroms, and c=8.70 Angstroms. Beta HMX is stable to about 102°C to 104.5°C, when the crystalline structure is converted to the alpha form. The crystals of the alpha form are orthorhombic with a density of 1.82 grams per cubic centimeter. The unit cell dimensions are a=15.14 Angstroms, b =23.89 Angstroms, c = 5.91 Angstroms. At approximately 160°C to 164°C the meta stable gamma form exists. The crystals of the gamma form are monoclinic with a density of 1.76 grams per cubic centimeter. The unit cell dimensions are a=10.95 Angstroms, b =7.93 Angstroms, and c = 14.61 Angstroms. Above the 160°C to 164°C range to the melting point, the delta form exists. The crystals of the delta form are hexagonal with a density of 1.80 grams per cubic centimeter. The unit cell dimensions are a=7.71 Angstroms and b=32.55 Angstroms. The polymorphs may also be prepared by precipitation from solution under various conditions. The beta form is precipitated from a solution of HMX in acetic acid, acetone, nitric acid, or nitrometrane with very slow cooling. The alpha form is precipitated from the same solution with more rapid cooling and the gamma form is precipitated with even more rapid cooling. The delta form is crystallized from solution such as acetic acid orbetachloroethyl phosphate, in which HMX is only slightly soluble. Very rapid chilling of the solution is required.

**Cyclotrimethylenetrinitramine (RDX)** This explosive is also known as: hexahydro-1,3,5-trinitro-1,3,5-triazine; 1,3,5-trinitro1,3,5-triazacyclohexane; cyclotrimethylene trinitramine; hexogen; cyclonite; or 1,3,5-trinitrotrimethylene-triamine.The compound is a white solid with a density of 1.806 grams per cubic centimeter, a nitrogen content of 37.84 percent, and a molecular weight of 222.13. RDX has orthorhombic crystals with a wide variety of habits; from needles when precipitated from HNO3, to plates when precipitated from acetic acid, to a massive form when precipitated from nitroethane or acetone. The unit cell dimensions are a=13.18 Angstroms, b = 1 1.57 Angstroms, and c = 10.71 Angstroms, and there are eight molecules per cell unit. On the Moh's scale RDX has a scratch hardness of 2.5. Other properties of pure RDX include a specific heat as shown in table 8-15 and a heat of combustion at constant pressure of 2,307.2 calories per gram. The heat of formation value is + 14.71 kilocalories per mole. RDX has an extremely low volatility. Pure RDX is used in press loaded projectiles but not in cast loaded projectiles because of extensive decomposition at the melting point. Cast loading is accomplished by blending RDX with a relatively low melting point substance. Compositions in which the RDX particles are coated with wax are called Composition A, in mixtures with TNT, Composition B, and blends with a nonexplosive plasticizer, Composition C. Straight RDX is used as a base charge in detonators and in some blasting caps, and as an oxidizer in specialized gun propellant.

**Ethylenediamine Dinitrate (EDDN)** This explosive is also designated EDD or EDAD. The compound is composed of white crystals with a specific gravity of 1.595 at 25/40, a nitrogen content of 30.10 percent, an oxygen balance to C02 of-25.8 percent, a melting point of 185° to 187°C, and a molecular weight of 186.13. The compound is soluble in water, but insoluble in alcohol or ether. EDDN has a heat of combustion of 374.7 kilocalories per mole at constant pressure, a heat of formation of 156.1 kilocalories per mole, and a heat of explosion of 127.9 to 159.3 kilocalories per mole. Eutectics are formed with ammonium nitrate, but EDDN is immiscible with molten TNT. An aqueous solution of EDDN is distinctly acidic. EDDN has been used to a limited extent as a bursting charge pressed in shells and as a cast charge in eutectic mixtures with ammonium nitrate. Mixtures with wax were used in boosters during World War II by the Germans.

**Ethylenedinitramine (Haleite)** This compound is also known as N’ N'-dinitroethylene diamine; ethylene dinitramine; or 1,2-dinitrodiaminoethane, and is sometimes designated EDNA. The name Haleite is in recognition of the development of this compound as a military explosive by the late Dr. G. C. Hale of Picatinny Arsenal. The compound is white with an orthorhombic crystal structure, a nitrogen content of 37.33 percent, anoxygen balance to CO2 of-32 percent, an oxygen balance to CO of-10.5 percent, and a molecular weight of 150.10. The density of the crystals vary from 1.66 to 1.77 depending on the solvent from which the crystallization took place.

**Nitroguanidine (NQ)** This explosive is also known as picrite or guanylnitramine. The compound has a nitrogen content of 53.84 percent, an oxygen balance to CO2 of -30.8 percent, a theoretical maximum density of 1.81 grams per cubic centimeter, a nominal density of 1.55 to 1.75 grams per cubic centimeter, and a molecular weight of 104.1. The melting point of nitroguanidine varies somewhat with the rate of heating. The pure material melts with decomposition at 232°C, but values from 220°C to 250°C are obtainable with various heating rates. At least two crystalline forms exist for nitroguanidine; alpha and beta.

**2, 4,6Trinitrophenylmethylnitramine (Tetryl)** This explosive is also known as: 2,4,6tetranitro-N-methyl aniline; N-methyl-N,2,4,6tetranitro-benzenamine; 2,4,6-trinitrophenylmethylnitramine; tetranitromethylamulene; or picrylmethylnitramine and is sometimes referred to as pyronite, tetrylit, tetralite, tetralita, or CE. The compound is colorless when freshly prepared and highly purified, but rapidly acquires a yellow color when exposed to light. Tetryl has a nitrogen content of 24.4 percent, an oxygen balance to CO2 of-47 percent, a nominal density of 1.71 grams per cubic centimeter with a theoretical maximum density of 1.73 grams per cubic centimeter, and a molecular weight of 287.15. The melting point of the pure substance is 129.45°C and of the technical grade, 129°C.

**Nitroaromatics.** Compounds in this class are prepared by C-type nitration in which a nitrogroup is attached to a carbon atom of the compound being nitrated.

**Ammonium Picrate** This explosive is also known as ammonium 2,4,6-trinitrophenolate, explosive D, and Dunnite. The compound has a nitrogen content of 22.77 percent, an oxygen balance to C02 of- 52 percent, a maximum crystal density of 1.717 grams per cubic centimeter, a nominal density of 1.63 grams per cubic centimeter, a melting point with decomposition
of about 280°C and a molecular weight of 246. Ammonium picrate exists in a stable form as yellow,
monoclinic crystals and a meta stable form as red, orthorhombic crystals. The unit cell dimensions are a =13.45 Angstroms, b

**1,3-Diamino-2,4,6-Trinitrobenzene (DA TB)** This explosive is also known as 2,4,6trinitro-1,3-diaminobenzene; 2,4,6-trinitro-7,3benzenediamine trinitro-m-phenylenediamine; or 2,4,6-trinitro-1 ,3-diaminobenzol and may be referred to as DATNB. The compound is a yellow, crystalline solid with a nitrogen content of 28.81 percent, a melting point of 2860C to 301°C with decomposition, and a molecular weight of 243.14.

**1,3,5Triamino-2, 4,6Trinitrobenzene (TA TB)** This explosive is also known as 2,4,6trinitro-1,3,5-benzenetriamine and may be referred to as TATNB. TATB has a nitrogen content of 32.56 percent, an oxygen balance to C02 of -55.78 percent, and a molecular weight of 258.18. TATB is yellow but exposure to sunlight or ultraviolet light causes a green coloration which, with prolonged exposure, turns brown. The compound has a theoretical maximum density of 1.937 grams per cubic centimeter and a nominal density of 1.88 grams per cubic centimeter. An instantaneous hot bar decomposition temperature of 450°C to 451 °C was reported with rapid thermal decomposition above 320°C. The structure of the crystalline lattice of TATB contains many unusual features. Some of these are the extremely long C-C bonds in the benzene ring, the very short C-N bonds, amino bonds, and the six furcated hydrogen bonds. Evidence of a strong intermolecular interaction, hydrogen bonds, in TATB is indicated by the lack of an observable melting point and very low solubility. The intermolecular network results in a graphite-like lattice structure with the resulting properties of lubricity and intercalaction.

**2,4,6-Trinitrotoluene (TNT)** This explosive is also known as trotyl, tolit, triton, tritol, trilite, and 1-methyl-2,4,6-trinitrobenzene. TNT has been the most widely used military explosive from World War I to the present time. The advantages of TNT include low cost, safety in handling, fairly high explosive power, good chemical and thermal stability, favorable physical properties, compatibility with other explosives, a low melting point favorable for melt casting operations, and moderate toxicity. There are six possible ring nitrated TNT isomers. The alpha isomer, which is the one of military interest  is symmetrical and will be referred to as TNT. The other five meta isomers will be identified by the Greek letters beta through eta excluding zeta. TNT is a yellow, crystalline compound with a nitrogen content of 18.5 percent, an oxygen balance to CO2 of-73.9 percent, a molecular weight of 227.13, and a melting point of 80°C to 81°C. TNT shows no deterioration after 20 years storage in a magazine.

**Impurities Present in TNT**

2,4,5-Trinitrotoluene
2,3,4-Trinitrotoluene
2,3,6-Trinitrotoluene
2,3,5-Trinitrotoluene
3,4,5-Trinitrotoluene
2,6-Dinitrotoluene
2,4-Dinitrotoluene
2,3-Dinitrotoluene
2,5-Dinitrotoluene
3,4-Dinitrotoluene
3,5-Dinitrotoluene
1,3-Dinitrobenzene
1,3,5-Trinitrobenzene
2,4,6-Trinitrobenzyl alcohol
2,4,6-Trinitrobenzaldehyde
2,4,6-Trinitrobenzoic acid
Alpha-nitrato-2,4,6-trinitrotoluene
Tetranitromethane
2,2'-Dicarboxy-3,3',5,5'-tetranitroazoxybenzene (white compound)
2,2',4,4',6,6'-Hexanitrobibenzyl (HNBB)
3-Methyl-2',4,4',6,6'-pentanitrodiphenylmethane(MPDM)
3,3',5,5'-Tetranitroazoxybenzene

**Compositions** are explosives in which two or more explosive compounds are mixed to produce an explosive with more suitable characteristics for a particular application. Generally, the characteristics of the composition are intermediate between the characteristics of the individual explosive ingredients. For example, the addition of TNT to RDX reduces brisance somewhat but considerably improves sensitivity. The composition explosives are categorized by the number of ingredients contained in the mixture.

**Binary Mixtures**

**Amatols** are binary mixtures of ammonium nitrate and TNT. The percentages of ammonium nitrate and TNT are reflected in the nomenclature for each mixture, for example, 80/20 amatol consists of 80 percent ammonium nitrate and 20 percent TNT. Ammonium nitrate is insoluble in TNT. The chemical and physical properties of the constituents determine the properties of the amatol. The mixture begins to melt at TNT's melting point but the ammonium nitrate, which has a higher melting point, remains solid.

**Composition A** explosives consist of a series of formulations of RDX and a desensitizer. Compositions A and A2 contain the same percentages of materials as composition A3 but the type of wax used and the granulation requirements for the RDX are different. Composition A contains beeswax, while composition A2 contains a synthetic wax. Compositions A and A2 are no longer used. All of the composition A explosives are press loaded. The density of composition A3 is 1.47 and 1.65 grams per cubic centimeter when pressed to 20,685 kilopascals (3,000 pounds per square inch) and 82,740 kilopascals (12,000pounds per square inch), respectively.

**Composition B** type explosives are mixtures of RDX and TNT. Composition B refers to mixtures of approximately 60 percent RDX and 40 percent TNT. Other portions of RDX and TNT are called cyclotols.

**Composition C** During World War II, the British used a plastic demolition explosive that could be shaped by hand and had great shattering power. As standardized by the United States, this explosive was designated as composition C and contained 88.3 percent RDX and 11.7 percent of a nonexplosive oily plasticizer. Included in the plasticizer was 0.6 percent lecithin, which helped to prevent the formation of large crystals of RDX which would increase the sensitivity of the composition.

**Ednatols** are mixtures of halite (ethylene dinitramine) and TNT. The most used haleite/TNT portions are 60/40, 55/45, and 50/50. Ednatols are yellowish, uniform blends with a melting point of 80°C. The eutectic temperature is about 80°C. In an extrudation test at 65°C there was no extrudate. Ednatols are considered satisfactory for bursting charges in ammunition. All of the following data in the discussion of the properties of ednatol refer to the 55/45 mixture. 55/45 Ednatol has an oxygen balance to carbon dioxide of -51 percent and to carbon monoxide of - 17 percent. The density of the cast explosive is 1.62 grams per cubic centimeter, which is four percent greater than that of cast TNT or haleite pressed under 206,850 kilopascals (30,000 pounds per square inch).

**LX-14** is an explosive which consists of 95.5 percent HMX and 4.5 percent estane 5702-F1. The mixture is a white solid with violet spots. LX-14 has a theoretical maximum density of 1.849 grams per cubic centimeter, a nominal density of 1.83 grams per cubic centimeter, and a melting point of greater than 270°C, with decomposition. The heat of formation is 1.50 kilocalories per mole. The calculated heats of detonation are 1.58 kilocalories per gram with liquid water and 1.43 kilocalories per gram with gaseous water. At a density of 1.835 grams per cubic centimeter the detonation velocity is 8,830 meters per second.

**Octols** are mixtures of HMX and TNT. Octol is used as an oil well formation agent and in fragmentation and shaped charges. In fragmentation tests using a 105 millimeter M1 shell, 15 percent more fragments are produced and the average velocity of the fragments is 100 meters per second faster than with a similar shell loaded with composition B. This improvement is attributed to both the higher rate of detonation of octol and the greater density of octol which permits a greater weight of explosive in the same volume.

**Pentolite** are castable explosive mixtures containing PETN and TNT. The most commonly used blend consists of 50/50 PETN/TNT. Other blends such as 75/25, 40/60, 30/70, and 10/90 have been occasionally employed but the 50/50 blend is superior in the characteristics of sensitivity to initiation, brisance, and suitability for melt loading. 87 percent TNT and 13 percent PETN form a eutectic with a freezing point of 76.7°C. Cast 50/50 pentolite, therefore, consists of 42.2 percent PETN, and 57.8 percent of the eutectic mixture.

**Picratol** is a mixture of 52 percent ammonium picrate and 48 percent TNT. Molten TNT has little or no solvent action on ammonium picrate, and consequently, cast picratol consists essentially of a physical mixture of crystals of the two explosives. The density of cast picratol is 1.61 to 1.63. This permit’s a weight of charge almost equal to that

**Tetrytols** are light yellow to buff mixtures of TNT and tetryl. As is the case for tetryl, tetrytols are no longer used by the United States but are still being used by other nations including various NATO allies. Tetrytols resemble tetryl more closely than they resemble TNT. They are more powerful but less sensitive than TNT. Tetrytols can be cast into munitions, which is an advantage over press loading. Table 8-73 compares the physical characteristics of various detritus compositions.

**Ternary Mixtures**

**Amatex 20** The mixture has a nominal density of 1.61 grams per cubic centimeter and is used as a filler in ammunition items.

**Amatex 20** consists of:

| | |
|---|---|
| RDX | 40 percent |
| TNT | 40 percent |
| Ammonium nitrate | 20 percent |

**Ammonal**

**Ammonals** are mixtures containing, as principle ingredients, ammonium nitrate and powdered aluminum incorporated with high explosives such as TNT, DNT, and RDX. Powdered carbon was also used in earlier ammonals. In the ammonals that do not contain carbon, the mixture of ammonium nitrate and high explosive detonates developing a very high temperature which causes volatilization of the aluminum powder. In general, ammonals are fairly insensitive and stable mixtures but are hygroscopic due to the presence of ammonium nitrate. In the presence of moisture, ammonals react with the same metals as amatols: copper, bronze, lead, and copper plated steel.

**(HTA-3)** are mixtures of HMX, TNT, and aluminum

**Minol-2** are mixtures of TNT, ammonium nitrate, and aluminum.

**Torpex** is a silvery white solid when cast. The composition of torpex is 41.6 percent RDX, 39.7 percent TNT, 18.0 percent aluminum powder, and 0.7 percent wax.

**Quanternary Mixtures**

**Depth bomb explosive (DBX)** is the only explosive covered under quanternary mixtures. DBX consists of:

| | |
|---|---|
| TNT | 40 percent |
| RDX | 21 percent |
| Ammonium nitrate | 21 percent |
| Aluminum | 18 percent |

**Industrial Explosives**

**Dynamites** Military operations frequently necessitate excavation, demolition, and cratering operations for which the standard high explosives are unsuited. Recourse is made to commercial and special compositions. Commercial blasting explosives, with the exception of black powder, are referred to as dynamites although in some cases they contain no nitroglycerin.

**Ammonium nitrate fuel oil explosives (ANFO)** When ammonium nitrate is mixed with approximately 5.6 percent of a combustible material such as fuel oil, the heat liberated on detonation is increased by almost three-fold.

# Propellants

## CHAPTER 9
## UNITED STATES PROPELLANTS

**Introduction** Selection of a propellant for an application is made on the basis of the requirements of that specific application. In general, guns are designed to meet specified performance standards and withstand a specific pressure in the barrel. With a knowledge of the properties of the constituents normally used for propellants, the propellant designer creates a formulation to satisfy the performance standards and limitations of the gun. When ignited, the propellant produces large quantities of hot, gaseous products. Complete combustion or deflagration of the propellant occurs in milliseconds in guns and the pressure produced accelerates the projectile down the barrel.

**Single-base propellants** M1, M6, M10, and IMR.

**Double-base gun propellants** M2, M5, M8 and M18.

**Triple-base gun propellants** contain nitroguanidine as additional energizer which increases the energy content of the formulation without raising the flame temperature.

**Composite propellants**, used in solid fuel rockets, contain a polymer binder, a fuel, and an oxidizer.

**Ball Propellants**

**Propellants Compounds: M1, M2, M5, M6, M8, M10, M31, M30, IMR, M18**

- Nitrocellulose (NC)
- Nitrogen
- Nitroglycerin
- Barium nitrate
- Potassium nitrate
- Potassium sulfate
- Lead carbonate
- Nitroguanidine
- Dinitrotoluene
- Dibutylphthalate
- Diethylphthalate
- Diphenylamine
- Ethyl centralite
- Graphite
- Cryolite
- Ethyl alcohol (residual)

**Diphenylamine**, (C6H5)2NH, is an ammonia derivative in which two of the hydrogens have been replaced by phenyl groups. Each phenyl ring has three hydrogens which can be replaced with nitro groups. Therefore, DPA can be

nitrated to the hexanitrate by absorbing the nitrogen oxides produced during the decomposition of nitrocellulose. DPA is nitrated relatively easily and the reaction is not exothermic. During the decomposition of nitrocellulose, DPA nitrates to the following compounds in succession.

N-nitrosodiphenylamine
2-nitrodiphenylamine
4-nitrodiphenylamine
N-nitroso-2-nitrodiphenylamine
N-nitroso-4-nitrodiphenylamine
4,4', 2,4', 2,2', and 2,4-dinitrodiphenylamines
N-nitroso-4, 4'-dinitrodiphenylamine
N-nitroso-2, 4'-dinitrodiphenylamine
2, 4, 4' and 2, 2', 4-trinitrodiphenylamines
2,2', 4,4'-tetranitrodiphenylamine
2,2', 4,4', 6-pentanitrodiphenylamine
Hexanitrodiphenylamine

The propellant does not start to become unstable until most of the diphenylamine has been converted to hexanitrodiphenylamines. A very accurate test to measure the remaining safe storage life in a propellant lot is to analyze the distribution profile of the nitro DPAs. Only about one percent DPA can be added to a propellant because its nitrated products change the ballistic properties.

**Centralite I** (which is also called ethyl centralite or symmetrical diethyldiphenylurea), OC [N-(C2H5) (C6H5)]2, was developed in Germany for use in double base propellants. The compound acts as a stabilizer, gelatinizer, and waterproofing agent. Unlike diphenylamine, centralite can be used in relatively large proportions and some propellant compositions contain as much as eight percent of this material. Like diphenylamine, centralite is nitrated by the products of nitrocellulose decomposition. The following compounds are formed successively, as many as four being present simultaneously, as deterioration of the powder proceeds.

4-nitrocentralite
4,4' dinitrocentralite
N-nitroso-N-ethylaniline
N-nitroso-N-ethyl-4-nitraniline
2,4, dinitro-N-ethyl-aniline

**Centralite II** (which is also called methyl centralite or symmetrical dimethyl diphenylurea), OC[N(CH3) (C6H5)]2, also has been used as a stabilizer but is not considered to be as effective as the ethyl analogue

**Three akardites**, or acardites, are used to stabilize propellants. Akardite II is often used in DEGN containing propellants.

# Pyrotechnic Devices

## Military Explosives (Chemistry) 30 September 1984

### CHAPTER 10
### UNITED STATES PYROTECHNICS

Pyrotechnics are used to send signals, to illuminate areas of interest, to simulate other weapons during training, and as ignition elements for certain weapons.(1)

All pyrotechnic compositions contain oxidizers and fuels. Additional ingredients present in most compositions include binding agents, retardants, and waterproofing agents. Ingredients such as smoke dyes and color intensifiers are present in the appropriate types of compositions.

**Oxidizers:** are substances in which anoxidizing agent is liberated at the high temperatures of the chemical reaction involved.

**Fuels:** include finely powdered aluminum, magnesium, metal hydrides, red phosphorus, sulfur, charcoal, boron, silicon, and suicides. The most frequently used are powdered aluminum and magnesium.

**Binding agents:** include resins, waxes, plastics, and oils. These materials make the finely divided particles adhere to each other when compressed into pyrotechnic items.

**Retardants** are materials that are used to reduce the burning rate of the fuel-oxidizing agent mixture, with a minimum effect on the color intensity of the composition.

**Waterproofing agents** are necessary in many pyrotechnic compositions because of the susceptibility of metallic magnesium to reaction with moisture, the reactivity of metallic aluminum with certain compounds in the presence of moisture, and the hygroscopicity of nitrates and peroxides.

**Color intensifiers:**

hexachloroethane (C2CI6)
hexachlorobenzene (C6CI6)
polyvinyl chloride
dechlorane (C1oCI12).

**Smoke dyes** are azo and anthraquinone dyes. These dyes provide the color in smokes used for signaling, marking, and spotting.

**Flares and Signals** The illumination provided by a flare is produced by both the thermal radiation from the product oxide particles and the spectral emission from excited metals.

**Infrared Flare Formulas:**

Silicon
KNO3
CsNO3
RbNO3
Hexamethylene
tetramine
Epoxy resin

**Red-Green Flare System:**

Barium nitrate
Strontium nitrate 13
Potassium perchlorate
Magnesium
Dechlorane
Polyvinyl acetate resin

**Signal flares** are smaller and faster burning than illuminating flares. Various metals are added these compositions to control the color of the flame.

**Colored and White Smoke** The pyrotechnic generation of smoke is almost exclusively a military device for screening and signaling. Screening smokes are generally white because black smokes are rarely sufficiently dense. Signal smokes, on the other hand, are colored so as to assure contrast and be distinct in the presence of clouds and ordinary smoke.

**Venturi thermal generator type.** The smoke producing material and the pyrotechnic fuel block required to volatilize the smoke material are in separate compartments. The smoke producing material is atomized and vaporized in the venturi nozzle by the hot gases formed by the burning of the fuel block.

**Burning type.** Burning type smoke compositions are intimate mixtures of chemicals. Smoke is produced from these mixtures by either of two methods. In the first method, a product of combustion forms the smoke or the product reacts with constituents of the atmosphere to form a smoke. In the second method, the heat of combustion of the pyrotechnic serves to volatilize a component of the mixture which then condenses to form the smoke. White phosphorus, either in bulk or in solution, is one example of the burning type of smoke generator.

**Explosive dissemination type.** The smoke producing material is pulverized or atomized and then vaporized, or a preground solid is dispersed by the explosion of a bursting charge. The explosive dissemination smoke generator may contain metallic chlorides which upon dispersal, hydrolyze in air. Examples are titanium, silicon, and stannic tetrachloride.

**Smoke Agent Mixtures:**

White phosphorus
Sulfur trioxide

FS agent
HC mixture
FM agent
Crude oil

**The preferred method of dispersing colored smokes** involves the vaporization and condensation of a colored organic volatile dye. These dyes are mixed to the extent of about 50 percent with a fuel such as lactose (20 percent) and an oxidizer (30 percent) for which potassium chlorate is preferred.

**Tracers and Fumers** The principal small arms application of military pyrotechnics is in tracer munitions where they serve as incendiaries, spotters, and as fire control. Two types of tracers are used. The difference between the two types is the method of tracking. The more frequently used tracer uses the light produced by the burning tracer composition for tracking. Smoke tracers leave a trail of colored smoke for tracking. Red is the flame color most often employed in tracers.

**Igniter and Tracer Compositions**

Strontium peroxide
Magnesium
1-136 Igniter
Calcium resinate
Barium peroxide
Zinc stearate
Toluidine red (identifier)
Strontium nitrate
Strontium oxalate
Potassium perchlorate
Polyvinyl chloride

**Incendiaries** Two types of incendiaries are commonly used. The traditional type is a bomb containing a flammable material. These materials include thermite (a mixture of aluminum and rust), phosphorus, and napalm. In addition, the case of the bomb may be constructed of a material such as magnesium that will burn at a high temperature once ignited.Depleted uranium is used extensively in pyrotechnics which have armor piercing capabilities.

Depleted uranium deficient in the more radioactive isotope U235, is the waste product of the uranium enrichment process. The depleted uranium is formed into projectiles that can penetrate armor because of their high density and mechanical properties. The impact of the projectile causes the uranium to form many pyrophoric fragments which can ignite fuel and munition items.

**Pyrophoric Metals**

| | |
|---|---|
| U | Uranium |
| Th | Thorium |
| Zr | Zirconium |
| Hf | Hafnium |

| | |
|---|---|
| Ce | Cerium |
| La | Lanthanum |
| Pr | Praseodymium |
| Nd | Neodymium |
| Sm | Samarium |
| Y | Yttrium |
| Ti | Titanium |

**Delays and Fuses** Delay compositions are mixtures of oxidants and powdered metals which produce very little gas during combustion.

**Photoflash Compositions** Photoflash compositions are the single most hazardous class of pyrotechnic mixtures. The particle size of the ingredients is so small that burning resembles an explosion. The various photoflash devices are similar, differing principally in size and the amount of delay.

**Colored smokes:**

Yellow: Auramine hydrochloride
Green: 1,4-Di-p-toluidinoanthraquinone with auramine hydrochloride
Red: 1-Methylanthraquinone
Blue: Not suitable for signaling because of excessive light scatter.

**Currently used dyes:**

Orange: 1-(4-Phenylazo)-2-naphthol
Yellow: N, N-Dimethyl-p-phenylazoaniline
Blue: 1,4-Diamylaminoanthraqdinone

**Black Powders Used in Pyrotechnics**

Potassium nitrate
Sodium nitrate
Charcoal
Coal (semibituminous)
Sulfur

**Ignition Mixtures Components**

Aluminum (powdered)
Ammonium dichromate
Asphaltum
Barium chromate
Barium peroxide
Boron (amorphous)
Calcium resinate
Charcoal
Diatomaceous earth (See also superfloss)
Fe203 (Red)
Fe304 (Black)
Potassium nitrate
Potassium perchlorate

Laminac
Magnesium (powdered)
Sodium nitrate
Nitrocellulose
Parlon (chlorinated rubber)
Pb02 -
Pb304
Sr peroxide
Sugar
Superfloss
Titanium
Toluidine red toner
Vegetable oil
Vistanex (polyisobutylene)
Zinc Stearate
Zirconium

# Table 4. Pyrotechnic Munitions Chemicals

**Chemicals found in practice and pyrotechnic munitions** [1 2]

| | | |
|---|---|---|
| Aluminum | Copper powder | Potassium chromate |
| Ammonium chloride | Chlorinated rubber (Parlon) | Potassium chlorate |
| Ammonium perchlorate | Cupric oxide | Polyvinyl acetate |
| Amorphous boron | Cuprous chloride | Polyvinylchloride (PVC) |
| Antimony sulfide | Calcium silicide | Perchlorate |
| Antimony metal powder | Cellulose-nitrate-plastic | Potassium dichromate |
| Anthracene | Dichloromethane | Potassium perchlorate |
| Asphaltum | Gilsonite | Resin (laminac) |
| Barium nitrate | Graphite | Red phosphorous |
| Barium chromate | Hexachlorobenzene | Selenium |
| Barium chlorate | Hexachloroethane (HC) | Sodium oxalate |
| Barium peroxide | Iron oxide | Sodium bicarbonate |
| Barium sulfate | Infusorial earth | Stearic acid |
| Bismuth tetroxide | Lead dioxide | Strontium nitrate |
| Butyl rubber | Lithium peroxide | Strontium carbonate |
| Calcium resinate | Lithium perchlorate | Strontium nitrate |
| Calcium fluoride | Magnesium | Strontium peroxide |
| Carbon tetrachloride | Magnese dioxide | Shellac |
| Calcium metal | Mercurous chloride | Tellurium |
| Cobalt naphthenate | Polyisobutylene (vistanex) | Titanium |
| Copper carbonate | Potassium iodate | Tungsten |
| Zirconium hydride | Zinc stearate | White phosphorous |
| Polychlorotrifluoroethylene | Manganese | Magnesium aluminum |
| Lead monoxide | Lead chromate | Diatomaceous Earth |
| Saltpeter | Cupric Oxide | Charcoal |
| Calcium Resinate | Sulphur | Calcium Phosphide |
| Red Gum | Barium Oxalate | Adhesive, Dextrin |
| Dextrin | Ammonium Nitrate | Orange Shellac |
| Auramine Hydrochloride | Stearin | Arsenic Disulphide |

**Dyes**

| | |
|---|---|
| 1-(2-Methoxyphenylazo)-2-Napthol Sudan Red G | 4-Dimethylamino Azobenzene |
| 1, 4 Dimethylamino Anthraquinone Fast Blue B | 1, 4 Diphenyl Toluidino Anthraquinone |
| 2-(4-Dimethylamino Phenylazo) Napthalene | 1-Amino Anthraquinone Fast Red A1 |
| Indanthrene Dye Golden Yellow GKAC | 4-Methylamino Anthraquinone |

CITY OF SALINAS
Public Works Department • 200 Lincoln Avenue • Salinas, California 93901 • (831) 758-7241

July 2, 2013

Monterey Regional Water Pollution Control Agency
ATTN: Bob Holden
5 Harris Court, Building D
Monterey, CA 93940

***Re: City of Salinas Response to Notice of Preparation, Monterey Peninsula Ground Water Replenishment Project Environmental Impact Report***

Mr. Holden,

The City of Salinas, via this letter, is providing general and specific comments that we believe should be addressed as part of the Environmental Impact Study Process, or considered in the context of the Ground Water Replenishment Project as it moves forward.

**General Comments:**

1. **National Environmental Policy Act (NEPA):** Varied and significant streams of funding will be required to complete implementation of the GWR project. We offer the observation that several aspects of this project could be and should be eligible for federal funding. (In fact the City of Salinas Industrial Waste Water Improvement Project that will link to this project is partially funded by a federal Economic Development Grant and will also include funding from loans secured by federal Community Development Block Grant funding). Given this possibility we believe it is prudent and wise to develop CEQA information in that could be used to satisfy compliance with the National Environmental Policy Act (NEPA). Meeting NEPA requirements sooner rather than later could serve to open other sources of funding. T-1

2. **California Regional Water Quality Control Board (Water Board):** Numerous permits issue by the regional and state California Water Boards will be required to implement this project.. We recommend that serious consideration be given, as soon as possible to secure these permits. Our expectation is that it would take the Water Board upwards of two years to issue new, or change existing permits previously issued. Given the aggressive timeline of this project, we believe a process that runs parallel with the environmental study processes be developed. We would also recommend that the Water Board be consulted early on to help define the process that would be required to obtain these permits. In other jurisdictions, similar projects have been issued "Master Permits" for water recycling and reuse projects. We recommend that this possibility also be explored. T-2

3. **Funding for Public Outreach:** After reviewing recent budget decisions made by the MRWPCA Board to fund Public Outreach for the GWR project, we believe funding is inadequate for the scale of project being proposed. MRWPCA needs to accept its role as a leader in water reuse and T-3

recycling and begin the effort required to gain approvals or agreements from two major economic engines (Agricultural and Hospitality), multiple local jurisdictions, agencies and citizen committees, as well as State and Federal organizations. We are concerned that MRWPCA has not in the past operated as an agency subject to high visibility in a heavily controversial environment. The recent history of major water projects in the County are a testament to how disagreement and lack of communication can cause essential projects to fail. MRWPCA must take the lead to ensure that all information associated with this project be broadly disseminated across multiple media platforms with honesty and transparency. This project will require the highest level of communication skills and effort to build community consensus if it is to succeed. This effort needs to begin immediately and with adequate funding. We believe that the environment in which this project will be developed is such that MRWPCA will need to "rethink" its communication strategies for this project, and that this effort will require far more funding than is currently provided. T-3 cont

4. **Independent Utility:** We encourage the MRWPCA to clarify and emphasize that the GWR Project stands on its own and has independent justification, purpose and utility separate from other water resource projects, including the desalination efforts. There is too much discussion about the extent to which the two are integrated and/or dependent on each other when it is not the case. T-4

5. **Options:** The NOP identifies and discusses Options A and B for potential routing of the pipelines to move the water from Salinas to the MRWPCA treatment facility in Marina. Both of these options start at the City of Salinas, agricultural wash-water settling ponds. There is also a pipeline that goes from the City of Salinas pump station at TP1 to the treatment facilities; Shouldn't this pipeline also be addressed as well? T-5

**Specific Comments:**

1. On page 8 the NOP states "*The GWR Project could not produce all of the needed replacement water, but the primary goal of the project is to produce 3,500 AFY to be used by Cal-Am in order to reduce its Carmel River diversions by that same amount*." Recent presentations to the CPUC made by MRWPCA representatives indicate a potential of 9,500 AFY to 12,500 AFY of available source water that could be used for GWR purposes. With the understanding that it takes approximately 4,200 AFY to produce 3,500 AFY of potable water via the GWR, we are concerned that the advanced treatment plan as proposed is inadequately sized to process the source water. We understand that the source water could also be recycled and used to satisfy irrigation needs (this of course would be supported by the City of Salinas) however there is only limited discussion of the actual amount of available source water and how it would ultimately be processed and distributed. This concern is also extended to the tertiary treatment with questions about the ability to process high amounts of source water. At the very minimum designing the advanced treatment facility so that it could be rapidly expanded is an important consideration T-6

2. On page 12, the NOP refers to the source water being provided from a combination of sources listed. We recommend that the MRWPCA clarify that the water may come from one of the options listed, or some combination of the potential sources listed. How will the MRWPCA determine which source or sources are used or drawn from and when? T-7

3. On page 12 (and a number of other places), there is a fair amount of detail specific to pipe sizes, capacity, pump location and pump sizes. We recommend that the MRWPCA remain flexible, where possible. We recommend that the CEQA study focus on routing and those issues of potential environmental significance and defer being too specific on some of the system details until the design is further along. If more than 3,500 AFY can be sourced from City of Salinas storm and agricultural wash water, and the MRWPCA can use that water for the greater good, would increasing the system capacity require new environmental processing? If so, is it possible to avoid his? T-8

4. On page 13 the NOP states "*A new 9,000-foot long, 30-inch diameter pipeline would transport water from the proposed new Blanco Drain pump station to the new GWR Project treatment facilities at the Regional Treatment Plant. Directional drilling would be used to cross under the Salinas River, and then the pipeline would be placed along the boundary of the Monterey Regional Waste Management District property to the MRWPCA's existing Regional Treatment Plant site.*" In terms of water conveyance systems, for both source and recycled water, it is important to extend our thinking into the future in terms of MRWPCA becoming a regional source of recycled water. Given this thinking, we recommend that two pipelines be placed simultaneously under the river while this work project is taking place. The cost saving and future benefits we believe would prove to be invaluable as MRWPCA began to provide recycle water back into the Salinas Valley for irrigation, or to increase volume of source water intake. The second pipeline would not necessarily be required to come into immediate use but could be capped at both ends until needed. However, the economies of scale realized by locating two pipelines with one permit under one contract should prove in the long term very cost effective and provide the kind of flexibility needed for this project. T-9

The City of Salinas appreciates the opportunity to comment on this important document. Should you have questions or wish clarification on our comments please contact me at 831-758-7390.

Regards,

Gary E. Petersen
Public Works Director

Kevin Flynn, Kimley-Horn and Associates

Letter U

Bill Carrothers Comment - my only comment on the GWR Project is the same as George Riley's. He and I are both interested in the costs associated with scaling up the proposal, and what it would cost to design the project to have the potential for future capacity increases. U-1

# APPENDIX E

# SUPPLEMENT TO MAY 2013 NOP

**SUPPLEMENT TO THE MAY 2013 NOTICE OF PREPARATION FOR THE MONTEREY PENINSULA GROUNDWATER REPLENISHMENT (PURE WATER MONTEREY) PROJECT ENVIRONMENTAL IMPACT REPORT**

---

**TO:** Agencies, Interested Parties, and Members of the Public
**DATE:** December 8, 2014
**SUBJECT:** Supplement to May 2013 Notice of Preparation of an EIR
**PROJECT TITLE:** Pure Water Monterey Groundwater Replenishment Project
**PROJECT LOCATION:** Northern Monterey County, California
**LEAD AGENCY:** Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

Staff contact: Mr. Bob Holden, Principal Engineer
Phone: (831) 372-3367 Fax: (831) 372-6178
Email: gwr@mrwpca.com

---

The Monterey Regional Water Pollution Control Agency (MRWPCA) is the Lead Agency for preparation of an Environmental Impact Report (EIR) under the California Environmental Quality Act (CEQA) for the Monterey Peninsula Groundwater Replenishment Project (now called the Pure Water Monterey GWR Project). MRWPCA commenced the CEQA process for the proposed project on May 31, 2013 when a Notice of Preparation (NOP) of an EIR was circulated for a 30-day public review period (SCH# 2013051094). MRWPCA considered and incorporated comments on the May 2013 NOP, and the Draft EIR for the project is well underway. On a parallel track, as a result of ongoing engineering and technical evaluations and regional coordination efforts, MRWPCA has updated the project description.

To provide public agencies, interested parties and members of the public with an opportunity to comment on the scope of the EIR related to updates to the project description, MRWPCA has decided to supplement the May 2013 NOP.

**Comment Period for Supplement to NOP**
MRWPCA invites public agencies, organizations and members of the public to submit written comments providing specific details about the scope and content of the environmental information in the EIR related to the updates to the project description. If commenting on behalf of a responsible or trustee agency, please also identify your specific areas of statutory responsibility. The public comment period on the Supplement to the NOP begins on December 10, 2014 and ends on January 8, 2014. Please send your written comments to Mr. Bob Holden at the address identified above, including your name, address, and contact information. If a response is not received from you within 30 days, the Lead

Agency will assume, in accordance with CEQA Guidelines section 15082(b)(2) that you have no comments on the Supplement to the NOP.

**Project Location and Background**

The Pure Water Monterey GWR Project would be located within northern Monterey County, and would include new facilities located within the unincorporated areas of the Salinas Valley and the cities of Salinas, Marina, Seaside, Monterey, and Pacific Grove. Figure 1 shows the proposed location of project facilities; locations that have been updated since publication of the May 2013 NOP are indicated by red dashed-line circles.

The Pure Water Monterey Groundwater Replenishment Project would create a reliable source of water supply for northern Monterey County. The project would provide purified water for recharge of the Seaside Groundwater Basin, and recycled water to augment the existing Castroville Seawater Intrusion Project's (CSIP) agricultural irrigation supply. The project is jointly sponsored by the MRWPCA and the Monterey Peninsula Water Management District (Water Management District).

The sources of water proposed to be recycled, treated and reused by the project are the same as those presented in the May 2013 NOP: municipal wastewater, industrial wastewater, urban stormwater runoff, and surface water diversions from the Blanco Drain and Reclamation Ditch. The source waters would be conveyed to the Regional Treatment Plant, which is located two miles north of the City of Marina and operated by MRWPCA.

The project objectives also have not changed. The primary objective of the project is to produce 3,500 acre-feet per year (AFY) of high quality replacement water to California American Water Company (CalAm) for delivery to its customers in the Monterey District Service area; thereby enabling CalAm to reduce its diversions from the Carmel River system by this same amount. CalAm is under a state order to secure replacement water supplies to reduce its Carmel River diversions by December 2016. CalAm also is required to reduce its pumping in the Seaside Groundwater Basin in accordance with the Watermaster's pumping mandates. Under the proposed project, highly treated water would be injected into the Seaside Basin. This highly-treated water would be produced from a new advanced water treatment facility that would be constructed at the Regional Treatment Plant and would treat the source waters identified above. The product water from the advanced treatment plant would be conveyed to and injected into the Seaside Basin via a new pipeline and new well facilities. The highly-treated water would then mix with the existing groundwater and be stored for future urban use by CalAm.

Another purpose of the project is to provide additional recycled water for crop irrigation in the CSIP area. Currently, the only sources of supply for the existing water recycling facility at the Salinas Valley Reclamation Plant (located at the Regional Treatment Plant site) are municipal wastewater and small amounts of urban dry weather runoff. Municipal wastewater flows have declined in recent years due to aggressive water conservation efforts by the MRWPCA member entities. By increasing the amount and type of source waters entering the wastewater collection system, additional recycled water can be provided for use in the CSIP area.

**Updates to the Pure Water Monterey GWR Project Description**

As noted above, ongoing engineering and technical evaluations and regional coordination efforts have resulted in some updates to the project description since the May 2013 NOP was issued. The full original project description is included in the *"Monterey Peninsula Groundwater Replenishment Project*

*Environmental Impact Report Notice of Preparation"* (May 2013), and is available for review at the MRWPCA Administrative Offices (5 Harris Court, Building D, Monterey, CA 93940) and on the project website: www. purewatermonterey.org. Following is a description of the project description updates.

- **Source waters:** All of the source waters identified in the May 2013 NOP are still being evaluated in the EIR as potential sources for the project. Ongoing engineering studies have now identified the volume of additional recycled water that could be provided to the CSIP area from the project. As source flows for the proposed project were studied and the seasonal variability of each was understood, the stakeholder agencies entered into a Memorandum of Understanding Regarding Source Waters and Water Recycling (MOU). The Parties to the MOU are the MRWPCA, the Monterey County Water Resources Agency, the City of Salinas, the Marina Coast Water District (MCWD), and the Monterey Peninsula Water Management District. The MOU is an agreement to "negotiate a Definitive Agreement to establish contractual rights and obligations of all Parties," that would include (1) protection of MCWD's recycled water right entitlement, (2) provision of up to 5,292 AFY of recycled water to Monterey County Water Resources Agency for the CSIP, and (3) provision of 3,500 AFY of highly treated water for injection into the Seaside Groundwater Basin and extraction by CalAm. The MOU also includes provisions for creation of a drought reserve, as discussed below. The MOU reflects the stakeholder agencies' positions regarding the combined benefits and conditions that would be required to secure the necessary rights and agreements to use the source waters needed for the proposed project.
- **Drought reserve storage and recovery:** The proposed project now includes a drought reserve component to support crop irrigation during dry years. Under this component, an extra 200 AFY of advanced treated water would be injected in the Seaside Basin during normal and wet years, up to a total of 1,000 AF, to create a "banked reserve." During drought years, MRWPCA would reduce the amount of water that it provides to the Seaside Groundwater Basin in order to increase production of recycled water for crop irrigation. CalAm would be able to extract the banked water in the Seaside Groundwater Basin to make up the difference to its supplies, such that its extractions and deliveries would not fall below 3,500 acre-feet per year.
- **Project facilities:** Ongoing technical and engineering evaluations have resulted in some new proposed project facilities and updates to other proposed facilities, as noted below.
  - *Optimization of recycled water production at the Salinas Valley Reclamation Project*: New improvements at the existing reclamation plant would enable it to produce more continuous flows in the winter and enhanced delivery to the CSIP area. Proposed improvements would include new sluice gates, a new pipeline between the existing inlet and outlet structures within the storage pond, chlorination basin upgrades, and a new storage pond platform. All of the modifications would occur within the existing Salinas Valley Reclamation Plant footprint. (Item #1 on Figure 1)
  - *Diversion location at Tembladero Slough.* The proposed project now includes a proposed diversion from Tembladero Slough, which is part of the Reclamation Ditch drainage system. This diversion would consist of a new intake structure on the channel bottom, which would connect to a new lift station on the channel bank via a new gravity pipeline. The new intake would be screened to prevent fish and trash from entering the new pump station. The new pump station would discharge through a new force main to the existing wet well at the MRWPCA Castroville Pump Station. The channel banks and invert near the pump station intake would be lined with concrete to prevent scouring. (Item #2 on Figure 1)

- *Removal of coastal recharge facilities as an injection location option in the Seaside Basin*: Groundwater modeling indicates that the coastal location is not feasible for injection. The proposed project now includes only the inland location for the injection facilities. Product water pipelines to that site have also been eliminated as a component of the proposed project. (Item #3 on Figure 1)
- *Inclusion of CalAm's proposed new distribution system pipelines as part of the GWR project*: Because the CalAm water supply system was initially built to deliver water from Carmel Valley to Monterey Peninsula cities, a hydraulic trough currently exists in the peninsula distribution system that prevents water delivery at adequate quantities from the Seaside Groundwater Basin to most of Monterey, and all of Pacific Grove, Pebble Beach, Carmel Valley, and City of Carmel areas. CalAm is proposing to construct two new pipelines, the Transfer and Monterey pipelines (located in Monterey), to bridge this trough. These pipelines are being studied in the EIR for the Monterey Peninsula Water Supply Project proposed by CalAm. Because the pipelines are also needed to deliver the full amount of GWR water injected into the Seaside Basin to CalAm customers, they are now also included as part of the GWR project. (Item #4 on Figure 1)
- *Method of collecting and conveying agricultural wash water from the Salinas Treatment Facility:* The May 2013 NOP envisioned that agricultural washwater would be conveyed by a new pump station and pipeline to a proposed new Blanco Drain pump station, and from there to the Regional Treatment Plant. This water is now proposed to be diverted from the existing Salinas collection and treatment facilities to the existing Salinas Pump Station. The wash water would then mix with the municipal wastewater and be conveyed through the existing 36-inch diameter Salinas interceptor to the Regional Treatment Plant. (Item #5 on Figure 1)

**Environmental Analysis**

As described within the May 2013 NOP, the EIR will assess the following issues of potential environmental effect: aesthetic resources, air quality and greenhouse gas emissions, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrogeology and groundwater quality, hydrology and surface water quality, land use and planning, noise and vibration, population and housing, transportation and traffic, other environmental issues (e.g., public services and utilities; energy delivery systems; agricultural, mineral and forest resources). The EIR will also evaluate growth-inducing effects that could result from implementation of the project, as well as cumulative impacts and alternatives to the project.

**Availability of Supplement to the NOP**

The Supplement to the NOP is available for a 30-day public review period beginning December 10, 2014 and ending January 8, 2015. Copies of the document are available for review at MRWPCA, 5 Harris Court, Building D, Monterey CA 93940 and on the MRWPCA website at: www.purewatermonterey.org. Additionally, copies of this document are available for review at the following libraries:

Seaside Public Library
Marina Public Library
Salinas Public Libraries
Castroville Public Library
Monterey Public Library
Carmel Valley Public Library

Re: Monterey Peninsula Groundwater Replenishment (Pure Water Monterey) Project
SCH# 2013051094

Attached for your review and comment is the Notice of Preparation (NOP) for the Monterey Peninsula Groundwater Replenishment (Pure Water Monterey) Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

**Bob Holden**
**Monterey Regional Water Pollution Control Agency**
**5 Harris Court, Building D**
**Monterey, CA 93940**

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Re: SUPPLEMENT TO THE MAY 2013 NOTICE OF PREPARATION FOR THE MONTEREY PENINSULA GROUNDWATER REPLENISHMENT (PURE WATER MONTEREY) PROJECT ENVIRONMENTAL IMPACT REPORT

Dear Mr. Holden:

Following are comments by WaterPlus on the 8 December 2014 supplement to the NOP for the Pure Water Monterey Project.

❖ **Claimed project benefits.** An overview of the project claimed the project would meet these goals:

- Create a reliable, publicly owned, safe water supply for Monterey Peninsula.
- Allow other, more energy-intensive, options such as seawater desalination to be smart-sized, thus enhancing the overall environmental benefits.
- Diversify the community's water supply portfolio for a more secure water supply.
- Be online sooner and use far less energy than most other water supply alternatives

To assure a safe water supply from advanced-level purification of municipal sewer water, you would need, in addition to the processes described, either an amount of fresh water equal to the amount of treated water for combined injection into the Seaside Aquifer or the filtration of the treated water in settlement ponds prior to aquifer injection, as in Santa Ana. The report makes no mention of these state Health Department requirements or of how the project intends to meet them. Does the project still intend to process municipal sewer water for injection into the Seaside Aquifer? If not, the supplement should say as much.

What does the overview mean by "smart-sized"? Reduced energy use? That in itself may be smart but still has to be demonstrated with comparable numbers describing this and alternative projects. The cost of this alternative must also be compared with the cost of others. The report claims $3,000 an acre-foot but needs to break down that figure into components and update it if necessary (for example, if it now includes the cost of DDT and other pesticide purification from agricultural run-off sources). The cost of desal per unit decreases with increasing plant size, and so down-sizing a desal plant only increases its cost. That is not smart. The large desal plant at Carlsbad is about $1,000 less costly per acre-foot than the proposed GWR project, and so the implication for smart-sizing would be to increase rather than decrease the desal-plant size. This conflict requires discussion and resolution.

Dependence on diversified water-supply sources can make a community vulnerable to the failure of the least reliable of the sources, which in this case would be GWR along with aquifer storage and recovery because both are vulnerable to drought while the first is also vulnerable to conservation efforts for whatever reason, as the supplement itself acknowledges. Diversification is not a given as a good thing. It needs objective discussion and substantiation.

Every water-supply option requires an energy audit, and this one is no exception. A desal plant at Moss Landing may be powered by solar and wind energy, for example, and the cost effect of that may still keep desal more than competitive with GWR. These comparisons need to be made objectively in an EIR if it is not to be merely a Public Relations document in disguise.

- **The MOU underlying the NOP supplement.** The supplement is at least partly the product of an MOU described as "an agreement to negotiate a Definitive Agreement to establish contractual rights and obligations of all Parties, that would include (1) protection of MCWD's recycled water right entitlement, (2) provision of up to 5,292 AFY of recycled water to Monterey County Water Resources Agency for the CSIP, and (3) provision of 3,500 AFY of highly treated water for injection into the Seaside Groundwater Basin and extraction by Cal Am."

This MOU does not indicate specifically how the parties to the agreement would deal with the 19,500 acre-feet of treated sewer water that Salinas Valley growers claim the right to use. Will the growers continue to have this right or will it be reduced? If any reduced amount is to be treated for injection into the Seaside Aquifer, as originally planned, has this option been presented to the public for approval by Cal Am customers and, particularly, by authorized representatives of the local hospitality industry? The NOP supplement must specify how much untreated water is needed to meet the treated-water requirement and indicate both (a) the sources of this water, together with the amount of water available annually from each, and (b) where the treatment residuals will go--important information for inclusion in an EIR .

In summary, the NOP document needs transformation from what in too many portions appears to be a Public Relations endorsement of the project to an objective and reliably documented project report.

Very respectfully,

Ron Weitzman
President, WaterPlus

RE: SCH # 2013051094 Monterey Peninsula Groundwater Replenishment (Pure Water Monterey) Project, Monterey County.

Dear Mr. Holden,

The Native American Heritage Commission (NAHC) has reviewed the Notice of Preparation (NOP) referenced above. The California Environmental Quality Act (CEQA) states that any project that causes a substantial adverse change in the significance of an historical resource, which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA Guidelines 15064(b)). To comply with this provision the lead agency is required to assess whether the project will have an adverse impact on historical resources within the area of project effect (APE), and if so to mitigate that effect. To adequately assess and mitigate project-related impacts to archaeological resources, the NAHC recommends the following actions:

- ✓ Contact the appropriate regional archaeological Information Center for a record search. The record search will determine:
  - If a part or all of the area of project effect (APE) has been previously surveyed for cultural resources.
  - If any known cultural resources have already been recorded on or adjacent to the APE.
  - If the probability is low, moderate, or high that cultural resources are located in the APE.
  - If a survey is required to determine whether previously unrecorded cultural resources are present.
- ✓ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
  - The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
  - The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.
- ✓ Contact the Native American Heritage Commission for:
  - A Sacred Lands File Check. **USGS 7.5-minute quadrangle name, township, range, and section required**
  - A list of appropriate Native American contacts for consultation concerning the project site and to assist in the mitigation measures. **Native American Contacts List attached.**
- ✓ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
  - Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) Guidelines §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
  - Lead agencies should include in their mitigation plan provisions for the disposition of recovered cultural items that are not burial associated, which are addressed in Public Resources Code (PRC) §5097.98, in consultation with culturally affiliated Native Americans.
  - Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, PRC §5097.98, and CEQA Guidelines §15064.5(e), address the process to be followed in the event of an accidental discovery of any human remains and associated grave goods in a location other than a dedicated cemetery.

Sincerely,

Katy Sanchez

From: PETER LE [mailto:peter381@sbcglobal.net]
Sent: Sunday, January 04, 2015 8:30 PM
To: GWR
Subject: Comments on the Supplement to May 2013 NOP dated December 8, 2014

January 4, 2015

Mr. Bob Holden
Principal Engineer, MRWPCA
Phone: 372-3367 Fax: 372-6178
gwr@mrwpca.com

I have the following comments on the scope and contents of the GWR (Pure Water Monterey) EIR prepared by MRWPCA based on the Supplement to May 2013 NOP dated December 8, 2014:

1. The EIR needs to analyze thoroughly, calculate and show in table format how the proposed project affects the agreed recycled water capacity and rights of the MCWD in the approximate amount of 1.1 MGD. If MCWD utilizes it 300 AF per month during summer months and the full 1.1 MGD recycled water during remaining months (not including any unused recycled water), how much treated water the proposed project can provide from different water sources? The EIR cannot assume that MCWD will not utilize its senior water rights of the recycled water in any given month and/or any given year. The EIR cannot assume that MCWD gives up its senior water rights of the recycled water either.

2. The MRWPCA claimed that it has spent about 3 million dollars on planning, designing and modifying the regional treatment plant to provide recycled water to MCWD under the executed 2009 RUWAP agreement. Will this project utilize the MCWD designs or modified regional treatment that will be paid by MCWD for this project? What additional work on the regional treatment plant that will be done on this project? How does MRWPCA identify and separate all costs for two different projects, MCWD and Pure Water Project?

3. What impacts does this proposed project affect the MCWD recycled water or RUWAP project in terms of completed designs? What is the required separation between MRWPCA recycled pipes and MCWD recycled pipes?

4. The EIR needs to consider the alternative of pumping excess winter flow from the Salinas River, treat it, and recharge the Seaside Aquifer.

5. How do the discharges of the proposed advanced water treatment plant and secondary source water affect the MCWD brine disposal capacity as described in the executed agreement with MRWPCA and the total capacity of the existing outfalls? What is the status of the executed MCWD brine disposal agreement with MRWPCA?

6. How does this project affect access to the District's property at the Armstrong Ranch and adjacent to the MRWPCA property and impact the proposed use of the District's property?

7. Will this EIR utilize any part of the adopted and paid for by MCWD RUWAP EIR and/or any previously EIR's adopted and paid for by MCWD?

The above comments are mine and they do not represent the official comments from MCWD. Let me know if you have any questions.

Sincerely,

signed by Peter Le

SURFRIDER FOUNDATION MONTEREY CHAPTER

gwr@mrwpca.com

Re: comments on Supplement to the Notice of Preparation for Monterey Peninsula Groundwater Replenishment Project - SCH#2013051094

*Via electronic mail*

Dear Mr. Holden,

Thank you for the opportunity to comment on the Supplement to the Notice of Preparation ("Supplement to the NOP") for the Monterey Peninsula Groundwater Replenishment Project. Surfrider Foundation is a non-profit environmental organization dedicated to the protection and enjoyment of oceans, waves, and beaches through a powerful activist network. In support of this mission, and specifically in support of protecting water quality and marine ecosystems, the Surfrider Foundation Monterey Chapter has been very engaged in the effort to identify water supply and demand offsetting solutions for peninsula cities, which would replace the deficit of water that was formerly supplied by the Carmel River and Seaside Groundwater Basin.

The Surfrider Foundation Monterey Chapter ("Surfrider") wishes to offer the following comments on the document:

On page three of the Supplement to the NOP, it ~~is mentioned~~ states that one of the project changes is the addition of a water diversion at Tembladero Slough, comprised of a new intake structure on the channel bottom screened to "prevent fish" from entering the pump system.

Although the Tembladero Slough is very impaired (--it is a Clean Water Act Section 303d-listed water body for impairments from pesticides, nutrients, fecal coliform, and ammonia), it serves an important role in delivering freshwater into the Elkhorn Slough and also supports aquatic life, including the federally listed tidewater goby. Surfrider is concerned that the proposed water diversion intake could adversely impact aquatic species through impingement and/or entrainment, and also that the loss of freshwater to this system could exacerbate the current impairments and further reduce the environmental services provided by the Tembladero Slough.

To ensure that the project is consistent with various environmental laws (including Endangered Species Act, Clean Water Act, Porter-Cologne Water Quality Control Act and the California Coastal Act, and others) and ~~therefore~~ also specifically to comply with the California Environmental Quality Act (“CEQA”) Surfrider believes it would be advisable to consider project alternatives that appropriately avoid or minimize impacts to aquatic life by a) using the Best Available Site, Design, and Technology to minimize impingement and entrainment to aquatic species at all life stages and b) minimizing the loss of freshwater from the Tembladero Slough to prevent further degradation of the water body. To achieve these objectives, it may be necessary to consider a project alternative that does not rely on water from the Tembladero Slough.

Thank you for consideration of these comments. Please continue to include the Surfrider Foundation Monterey Chapter in future notices related to this project.

Sincerely,

Antony Tersol
Vice Chair
Surfrider Foundation Monterey Chapter

**RE: MONTEREY PENINSULA AIRPORT DISTRICT COMMENTS FOR THE SUPPLEMENT TO MAY 2013 NOP OF AN EIR FOR THE MONTEREY PENINSULA GROUNDWATER REPLENISHMENT PROJECT**

Dear Mr. Holden:

Thank you for allowing the Monterey Peninsula Airport District (District) to comment on the project in subject. On behalf of the District, we are very interested in the outcome of this project and would like to be kept in the loop for future notifications.

We highly encourage you to inform the Monterey County Airport Land Use Commission (ALUC) of said project if you have not already done so. Currently, the proposed Lake El Estero Diversion Site is located within the Monterey Airport Influence Area (AIA) and therefore must be referred to the ALUC for a determination of consistency under the 1987 Comprehensive Land Use Plan (CLUP) for Monterey Peninsula Airport.

Additionally, the District is currently drafting a new Airport Land Use Compatibility Plan (ALUCP) that is estimated to be complete in 2016/2017. According to the Draft ALUCP, the Lake El Estero Diversion Site will not only be located within the AIA, but will also be located within the Outer Approach/Departure Safety Zone.

Please contact me if you have any questions.

Thank you,

Shelley Glennon

DEPARTMENT OF PLANS & PUBLIC WORKS

January 8, 2015

Mr. Bob Holden, Principal Engineer
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

**Subject: Comment Letter - Supplement to May 2013 Notice of Preparation (NOP) of an Environmental Impact Report (EIR), Pure Water Monterey Groundwater Replenishment Project**

Dear Mr. Holden,

Thank you for the opportunity to comment on the Pure Water Monterey Groundwater Replenishment Project (Project) Supplement to the NOP and related to the scope of the Environmental Impact Report (EIR) as a result of the updates to the project description. The City appreciates the efforts of the Monterey Regional Water Pollution Control Agency (MRWPCA) staff and project partners to continue the engineering and technical evaluations and regional coordination and collaboration efforts.

The project as currently defined includes a proposed water diversion from Lake El Estero pump station into the sanitary sewer collection system for regional treatment and future water use(s). As an agency with the jurisdictional responsibility for this portion of the project and in carrying out and/or approving the project under review, the City submits the following comments for consideration related to the scope and content of the environmental information to be included and/or considered in the EIR:

- **Project Description**: City staff has recognized a need to work with the MRWPCA to further refine the project description and scope to define parameters for the proposed water diversion from Lake El Estero to support the EIR analyses. To do this, the City suggests follow-up meeting(s) to discuss those parameters and to reflect a volume, timing, duration, and any other proposed parameters necessary to adequately characterize this diversion portion of the Project Description for environmental review.
- **Potentially Significant Environmental Issues and/or Environmental Information**: Below are potentially significant environmental issues and/or environmental information for consideration/review related to the project and Lake El Estero diversion, and as pertinent to hydrology and water quality, geology and soils, biological resources, cultural resources, and coastal resources (land use/planning) in the City of Monterey:
    - **Hydrology and Water Quality, and Geology and Soil Resources**: The City is aware a relatively shallow, unconfined aquifer exists in the vicinity of Lake El Estero, though its extent, surface connectivity/recharge, water quality, and seasonal fluctuations are not documented nor well understood. However, recent and localized geologic, soil, and

CITY HALL • MONTEREY • CALIFORNIA • 93940 • 831.646.3921 • FAX 831.646.3405
Website • www.monterey.org

groundwater level and quality data were collected and analyzed by Trinity Source Group Inc. The data were collected as a result of on-going soil and groundwater clean-up action related to legacy groundwater contamination at 951 Del Monte Avenue, a City property located across Del Monte Avenue from the proposed diversion facility. This information and these data are available for review.

- In the 1970s the City pumped groundwater for maintenance use/purposes from a City well along Aquajito Road near Washerwoman's Pond, which is a sediment basin with overflow connection to Lake El Estero. As described by City staff account, due to this groundwater withdrawal and use, an adjacent hotel structure began to experience land subsidence and associated structural impacts. Consequently, the City ceased pumping groundwater at this location. The exact date of the subsidence is unknown, and thus the climatic conditions that precipitated the event are also unknown, as are the volume and frequency of City well pumping at that time. As mentioned, the geologic and hydrologic setting in this watershed is largely undocumented or unknown, including the relationship between surface and groundwater resources. Although the subsidence account is based on institutional knowledge of this drainage area, this one occurrence may or may not be indicative of a local unconfined aquifer/groundwater table sensitive to changes in water table elevation due to withdrawals from its system.

- **Water Quality Resources:** Majors Creek is one tributary to Lake El Estero, and is listed with the Environmental Protection Agency (EPA) and State Water Resources Control Board (SWRCB) on the Clean Water Act Section 303(d) list for impaired water bodies. This relatively small urban creek with short open channel ephemeral drainage has a body of historic volunteer water quality data (Years 2000-2012) demonstrating total metals (copper, lead, zinc) and bacteria (E. coli) exceedances of water quality objectives of the Central Coast Basin Plan. And, recent water quality data collected as a part of a California State University Monterey Bay Majors Creek Existing Conditions study by A. Goodmansen (2014) confirmed similar results with continued metals and bacterial exceedances. The report highlights, among other possible factors, high traffic volumes in the upper watershed on State Highway 1 as a possible urban source for metals introduced to this ephemeral creek's flow. E. coli sources are unknown, and currently assumed to be natural as the City has no known issues with sewerage pipes in that location. If further DNA-typing of the E. coli is feasible in 2015, the City may gain greater clarity as to possible source(s). Also, Lake El Estero is signed by the Monterey County Health Department for "No Swimming. Contact with lake water may cause illness due to naturally occurring high bacteria levels". For these water quality reasons, the diversion of Lake El Estero discharges to the regional treatment facility instead of to the Monterey Bay may be a significant environmental benefit, depending on the defined diversion parameters to be analyzed.
- **Biological Resources**: Per City of Monterey General Plan EIR Figure 6 Major Habitat Types, the Lake El Estero vicinity is mapped with riparian/wetland habitat. Also tributary drainages are mapped to support Monterey Pine and Mixed Monterey Pine Forest habitat. More biological information is available in the technical supporting documentation titled *Biological Assessment for the City of Monterey* by Denise Duffy & Associates (2003). Further biological study may be necessary to determine or confirm the current day presence of biological resources that may exist since the 2003 biological assessment.

- **Cultural Resources**: Per City of Monterey General Plan EIR Figure 8, Archaeological Sensitivity Map, this diversion facility and proposed California American Distribution System Pipelines in the City of Monterey fall within an area of high probability of prehistoric artifacts, and will necessitate an Archaeological Report to conclude the likelihood of impact to cultural resources.
- **Coastal Resources (Land Use and Planning)**: It is unclear if portions of this project are proposed in the Coastal Zone within the City of Monterey. This aspect will need to be examined.
- **Regulatory Permitting**: As is assumed will be explored by the environmental team, the City wishes to note that various permits may be necessary from other agencies such as the U.S. Army Corps of Engineers, State Water Resources Control Board/Regional Water Quality Control Board, California Department of Fish and Wildlife, Coastal Commission, and possibly others as necessary, to implement the whole of this project.

As a critical natural and economic resource to the community and region, the City desires to ensure long-term coordinated water resources management and stewardship of Lake El Estero and its associated resources. Consequently and prior to City or regional consideration of a long-term sustainable water diversion effort from this watershed, a focused watershed study may be a necessary tool to understand existing, baseline geologic, hydrologic, and biological conditions. Such a study may include the extent and connectivity of surface and groundwater resources and associated environmental dynamics at work and resources present, including watershed recharge areas and rates, potential necessary minimum in-lake water levels and/or groundwater table elevations needed to healthfully maintain/sustain the lake and associated drainages and biological resources. Depending on any determined diversion parameters, such a study may behoove this environmental review effort and to support conclusions drawn as a part of the EIR analyses. Accordingly, the City would like to discuss this study potential further with the regional project team.

It's important to note that the City Council has yet to review any policy considerations related to this project. Accordingly, the comments herein are offered based on preliminary discussions and understanding of the collaborative and envisioned project, which is conceptually supported by City staff who are eager to assist in the refinement of the project description as it relates to those areas within the City's jurisdiction and looks forward to sharing information and data with the project team to further the study of this regional water project for environmental review.

Thank you for this opportunity to comment. Please feel free to contact me with questions.

Sincerely,

Dino Pick

Hello Valarie,

I just realized that we have not responded to your NOP, and the due date is today. Attached are three brochures that further explain the CWSRF Program environmental review process and the additional federal requirements. For the complete environmental application package please visit: http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml. The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by federal agencies or their representatives will need to be resolved prior to State Water Board approval of a CWSRF financing commitment for the proposed Project.

Thank you for considering our requirements. Please let me or Susan Stewart know if any questions or need additional information.

Hi Ahmad and Susan,
Attached please find Supplement to May 2013 Notice of Preparation (NOP) for the Monterey Regional Water Pollution Control Agency Groundwater Replenishment Project. You will recall we met with you back in January of this year to describe the project and discuss environmental review protocols. The project description has been updated since then, and we have issued this NOP Supplement to enable agency and public comment on the environmental review of the project updates. The NOP Supplement has been submitted to the State Clearinghouse and they will do their normal distribution, which includes the SWRCB. We wanted you to receive this directly from out team as well.

Please let us know if you have any questions, and wishing you both a happy holiday season.

Cheers,
Valerie Young

## National Historic Preservation Act (NHPA)

Section 106 of the NHPA requires an analysis of the effects on "historic properties." The Section 106 process is designed to accommodate historic preservation concerns for federal actions with the potential to affect historic properties. Early consultation with appropriate government agencies, Indian tribes, and members of the public, will ensure that their views and concerns are addressed during the planning phase.

Historic properties (i.e., buildings, structures, objects, and archaeological sites 50 years or older) are properties that are included in the National Register of Historic Places or meet the criteria for the National Register.

### Required Documents:

✓ A draft State Historic Preservation Officer consultation request letter; and

✓ A cultural resources report on historic properties conducted according to the Secretary of the Interior's Standards, including:

- A clearly defined Area of Potential Effect (APE), specifying the length, width, and depth of excavation, with a map clearly illustrating the project APE;
- A records search, less than one year old, extending to a half-mile beyond the project APE;
- Written description of field methods;
- Identification and evaluation of historic properties within the project's APE; and
- Documentation of consultation with the Native American Heritage Commission and local Native American tribes.

# ADDITIONAL INFORMATION

If your project has the potential to affect biological resources or historic properties, the consultation process can be lengthy. Please contact the State Water Board staff early in your planning process to discuss what additional information may be needed for your specific project.

Please contact your State Water Board Project Manager or Mr. Ahmad Kashkoli at (916) 341-5855 or *Ahmad.Kashkoli@waterboards.ca.gov* for more information related to the CWSRF Program environmental review process and requirements.

# ENVIRONMENTAL REVIEW REQUIREMENTS

The Clean Water State Revolving Fund (CWSRF) Program is partially funded by the United States Environmental Protection Agency (EPA), and is subject to federal environmental regulations as well as the California Environmental Quality Act (CEQA). All applicants seeking CWSRF financing must comply with both CEQA and the federal cross-cutting regulations. The "**Environmental Package**" provides the forms and instructions needed to complete the environmental review requirements for CWSRF financing. The forms and instructions are available at: *http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml.*

## Lead Agency/Applicant

The applicant will generally act as the "Lead Agency" for environmental review. It will prepare, circulate, and consider the environmental documents prior to approving the project. It also provides the State Water Board with copies of the CEQA documents, and a completed "**Environmental Evaluation Form for Environmental Review and Federal Coordination**" *(http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/docs/forms/application_environmental_package.pdf)* with supporting documents as part of the "**Environmental Package**."

## Responsible Agency/State Water Board

The State Water Board acts on behalf of EPA to review and consider the environmental documents before approving financing. The State Water Board may require additional studies or documentation to make its own CEQA findings, as well as circulate CEQA documents and other environmental reports to relevant federal agencies for consultation before making a determination about the project financing.

The Applicant must address all relevant federal agencies' comments before project financing is approved.

# FEDERAL CROSS-CUTTING REGULATIONS

The CWSRF Program requires consultation with relevant federal agencies on the following federal environmental regulations, if applicable to the project:

- Clean Air Act
- Coastal Barriers Resources Act
- Coastal Zone Management Act
- Endangered Species Act
- Environmental Justice
- Farmland Protection Policy Act
- Floodplain Management
- Magnuson-Stevens Fishery Conservation and Management Act
- Migratory Bird Treaty Act
- National Historic Preservation Act
- Protection of Wetlands
- Safe Drinking Water Act, Sole Source Aquifer Protection
- Wild and Scenic Rivers Act

The following is a brief overview of requirements for some of the key regulations.

## Clean Air Act (CAA)

The CAA general conformity analysis only applies to projects in areas not meeting the National Ambient Air Quality Standards or subject to a maintenance plan.

If project emissions are below the federal "de minimis" levels then:

- A general conformity analysis is not required.

If project emissions are above the federal "de minimis" levels then:

- A general conformity determination for the project must be made. A general conformity determination can be made if facilities are sized to meet the needs of current population projections used in an approved State Implementation Plan for air quality.

- Using population projections, applicants must explain how the proposed capacity increase was calculated.

An air quality modeling analysis is necessary of all projects for the following criteria pollutants, regardless of attainment status:

- Carbon monoxide
- Lead
- Oxides of nitrogen
- Ozone
- Particulate matter (PM2.5 and PM10)
- Sulfur dioxide

## Endangered Species Act (ESA)

The ESA requires an analysis of the effects on federally listed species. The State Water Board will determine the project's potential effects on federally listed species, and will initiate informal/formal consultation with the United States Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service, as necessary under Section 7 of the ESA.

### Required Documents:

✓ A species list, less than one year old, from the USFWS and the California Department of Fish and Wildlife's Natural Diversity Database;

✓ A biological survey conducted during the appropriate time of year;

✓ Maps or documents (biological reports or biological assessments, if necessary); and

✓ An assessment of the direct or indirect impacts to any federally listed species and/or critical habitat. If no effects are expected, explain why and provide the supporting evidence.

CLEAN WATER STATE REVOLVING FUND

# Basic Criteria for Cultural Resources Report Preparation

State Water Resources Control Board
Division of Financial Assistance

For Section 106 Consultation with the State Historic Preservation Officer (SHPO) under the National Historic Preservation Act

## CULTURAL RESOURCES REPORT

The Cultural Resources Report must be prepared by a qualified researcher that meets the Secretary of the Interior's Professional Qualifications Standards. Please see the Professional Qualifications Standards at the following website at: *http://www.cr.nps.gov/local-law/arch_stnds_9.htm*

The Cultural Resources Report should include one of the four "findings" listed in Section 106. These include:

***"No historic properties affected"***

(no properties are within the area of potential effect (APE; including below the ground).

***"No effect to historic properties"***

(properties may be near the APE, but the project will not have any adverse effects).

***"No adverse effect to historic properties"***

(the project may affect "historic properties", but the effects will not be adverse).

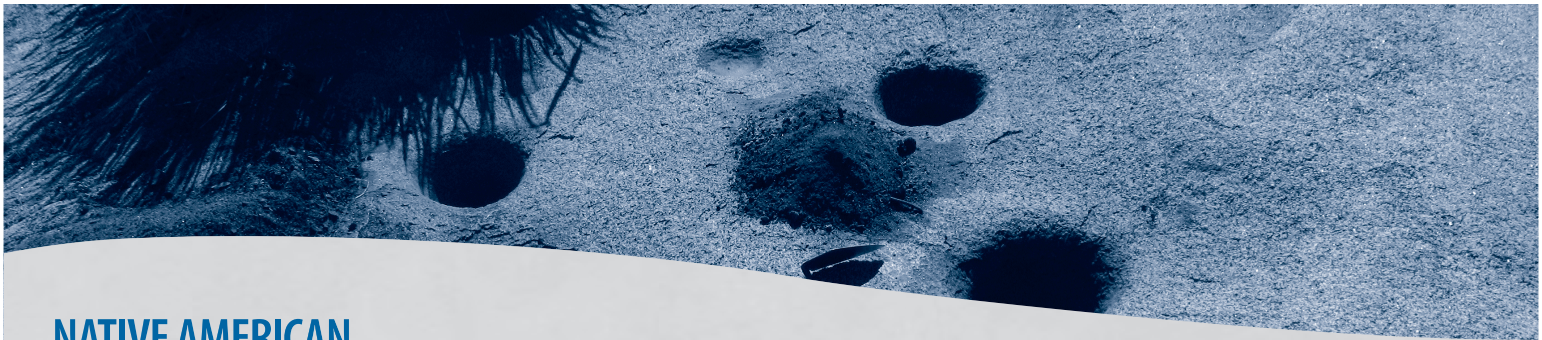
***"Adverse effect to historic properties"***

Note: Consultation with the SHPO will be required if a "no adverse effect to historic properties" or an "adverse effect to historic properties" determination is made, to develop and evaluate alternatives or modifications to the proposed project that could avoid, minimize or mitigate adverse effects on "historic properties."

## RECORDS SEARCH

- A records search (less than one year old) extending to a half-mile beyond the project APE from a geographically appropriate Information Center is required. The records search should include maps that show all recorded sites and surveys in relation to the APE for the proposed project, and copies of the confidential site records included as an appendix to the Cultural Resources Report.
- The APE is three-dimensional (depth, length and width) and all areas (e.g., new construction, easements, staging areas, and access roads) directly affected by the proposed project.

We've got the **green**...
to keep California's **water clean**.
CLEAN WATER STATE REVOLVING FUND



## NATIVE AMERICAN and INTERESTED PARTY CONSULTATION

- Native American and interested party consultation should be initiated at the planning phase of the proposed project to gather information to assist with the preparation of an adequate Cultural Resources Report.
- The Native American Heritage Commission (NAHC) must be contacted to obtain documentation of a search of the Sacred Lands Files for or near the project APE.
- All local Native American tribal organizations or individuals identified by the NAHC must be contacted by certified mail, and the letter should include a map and a description of the proposed project.
- Follow-up contact should be made by telephone and a phone log maintained to document the contacts and responses.
- Letters of inquiry seeking historical information on the project area and local vicinity should be sent to local historical societies, preservation organizations, or individual members of the public with a demonstrated interest in the proposed project.

Copies of all documents mentioned above (project description, map, phone log and letters sent to the NAHC and Native American tribal organizations or individuals and interested parties) must be included in the Cultural Resources Report.

## PRECAUTIONS

A finding of ***"no known resources"*** without supporting evidence is unacceptable. The Cultural Resources Report must identify resources within the APE or demonstrate with sufficient evidence that none are present.

***"The area is sensitive for buried archaeological resources,"*** followed by a statement that ***"monitoring is recommended."*** Monitoring is not an acceptable option without good-faith effort to demonstrate that no known resource is present.

If ***"the area is already disturbed by previous construction"*** documentation is still required to demonstrate that the proposed project will not affect "historic properties." An existing road can be protecting a buried archaeological deposit or may itself be a "historic property." Additionally, previous construction may have impacted an archaeological site that has not been previously documented.

## SHPO CONSULTATION LETTER

Submit a draft consultation letter prepared by the qualified researcher with the Cultural Resources Report to the State Water Resources Control Board. A draft consultation letter template is available for download on the State Water Board webpage at: *http://www.waterboards.ca.gov/water_issues/programs/grants_loans/cwsrf_requirements.shtml*

*Contact Information:* For more information related to the CWSRF Program Cultural Resources and Requirments, please contact Mr. Ahmad Kashkoli at 916-341-5855 or Ahmad.Kashkoli@waterboards.ca.gov

CALIFORNIA Water Boards
STATE WATER RESOURCES CONTROL BOARD
REGIONAL WATER QUALITY CONTROL BOARDS
waterboards.ca.gov

REVISED: JAN. 2014

CLEAN WATER STATE REVOLVING FUND

# California Environmental Quality Act Requirements

State Water Resources Control Board

Division of Financial Assistance

The State Water Resources Control Board (State Water Board), Division of Financial Assistance, administers the Clean Water State Revolving Fund (CWSRF) Program. The CWSRF Program is partially funded by grants from the United States Environmental Protection Agency. All applicants seeking CWSRF financing must comply with the California Environmental Quality Act (CEQA), and provide sufficient information so that the State Water Board can document compliance with federal environmental laws. The "Environmental Package" provides the forms and instructions needed to complete the environmental review requirements for CWSRF Program financing. It is available at: ***http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml***

We've got the **green**... to keep California's **water clean**.
CLEAN WATER STATE REVOLVING FUND

## LEAD AGENCY

The applicant is usually the "Lead Agency" and must prepare and circulate an environmental document before approving a project. Only a public agency, such as a local, regional or state government, may be the "Lead Agency" under CEQA. If a project will be completed by a non-governmental organization, "Lead Agency" responsibility goes to the first public agency providing discretionary approval for the project.

## RESPONSIBLE AGENCY

The State Water Board is generally a "Responsible Agency" under CEQA. As a "Responsible Agency," the State Water Board must make findings based on information provided by the "Lead Agency" before financing a project.

## ENVIRONMENTAL REVIEW

The State Water Board's environmental review of the project's compliance with both CEQA and federal cross-cutting regulations must be completed before a project can be financed by the CWSRF Program.

## DOCUMENT REVIEW

Applicants are encouraged to consult with State Water Board staff early during preparation of CEQA document if considering CWSRF financing. Applicants shall also send their environmental documents to the State Water Board, Environmental Review Unit during the CEQA public review period. This way, any environmental concerns can be addressed early in the process.

## REQUIRED DOCUMENTS

The Environmental Review Unit requires the documents listed below to make findings and complete its environmental review. Once the State Water Board receives all the required documents and makes its own findings, the environmental review for the project will be complete.

- ✓ Draft and Final Environmental Documents: Environmental Impact Report, Negative Declaration, and Mitigated Negative Declaration as appropriate to the project
- ✓ Resolution adopting/certifying the environmental document, making CEQA findings, and approving the project
- ✓ All comments received during the public review period and the "Lead Agency's" responses to those comments
- ✓ Adopted Mitigation Monitoring and Reporting Plan, if applicable
- ✓ Date-stamped copy of the Notice of Determination or Notice of Exemption filed with the County Clerk(s) and the Governor's Office of Planning and Research
- ✓ CWSRF Evaluation Form for Environmental Review and Federal Coordination with supporting documents

*Contact Information:* For more information related to the CWSRF Program environmental review process and requirements, please contact your State Water Board Project Manager or Mr. Ahmad Kashkoli at 916-341-5855 or Ahmad.Kashkoli@waterboards.ca.gov

Dear Mr. Nichols:

COMMENTS TO PURE WATER MONTEREY PROJECT

The California Department of Transportation (Caltrans), District 5, Development Review, has reviewed the above referenced project and offers the following comments in response to your summary of impacts.

- Any work within the State right-of-way will require an encroachment permit issued from Caltrans. Detailed information such as complete drawings, biological and cultural resource findings, hydraulic calculations, environmental reports, traffic study, etc., may need to be submitted as part of the encroachment permit process.

If you have any questions, or need further clarification on items discussed above, please don't hesitate to call me at (805) 542-4751.

Sincerely,

JOHN J. OLEJNIK
Associate Transportation Planner
District 5 Development Review Coordinator

**Subject: Supplemental Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Pure Water Monterey Groundwater Replenishment (GWR) Project,[1] Monterey County**

Dear Mr. Holden:

The California State Lands Commission (CSLC) staff has reviewed the subject Supplemental NOP for an EIR for the Pure Water Monterey GWR Project (Project), which is being prepared by the Monterey Regional Water Pollution Control Agency (MRWPCA). The MRWPCA, as a public agency proposing to carry out a project, is the lead agency under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.). The CSLC is a trustee agency for projects that could directly or indirectly affect sovereign lands and their accompanying Public Trust resources or uses. Additionally, if the Project involves work on sovereign lands, the CSLC will act as a responsible agency. CSLC staff requests that MRWPCA consult with us on preparation of the draft EIR as required by CEQA section 21153, subdivision (a), and the State CEQA Guidelines section 15086, subdivisions (a)(1) and (a)(2).

**<u>CSLC Jurisdiction and Public Trust Lands</u>**

The CSLC has jurisdiction and management authority over all ungranted tidelands, submerged lands, and the beds of navigable lakes and waterways. The CSLC also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions (Pub. Resources Code, §§ 6301, 6306). All tidelands and submerged lands, granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the Common Law Public Trust.

[1] Previously called the Monterey Peninsula Groundwater Replenishment Project

As general background, the State of California acquired sovereign ownership of all tidelands and submerged lands and beds of navigable lakes and waterways upon its admission to the United States in 1850. The State holds these lands for the benefit of all people of the State for statewide Public Trust purposes, which include but are not limited to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space. On tidal waterways, the State's sovereign fee ownership extends landward to the mean high tide line, except for areas of fill or artificial accretion or where the boundary has been fixed by agreement or a court. On navigable non-tidal waterways, including lakes, the State holds fee ownership of the bed of the waterway landward to the ordinary low water mark and a Public Trust easement landward to the ordinary high water mark, except where the boundary has been fixed by agreement or a court. Such boundaries may not be readily apparent from present day site inspections.

In order to determine if any portions of the Project will encroach onto lands under the jurisdiction of the CSLC, which would require a lease, please provide more detailed maps depicting the location and extent of proposed facilities within any rivers, particularly the Salinas River, and sloughs. From review of the supplemental NOP, it appears that the coastal groundwater recharge facilities have been removed from the Project. If any remaining facilities or infrastructure associated with the Project are planned for construction in the Pacific Ocean, please also provide detailed maps of these facilities.

**Project Description**

The MRWPCA proposes to produce and deliver high quality treated water for replenishment of the Seaside Basin to meet its and California American Water Company's (CalAm's) objectives and needs to reduce water diversions from the Carmel River.

From the Supplemental NOP, CSLC staff understands that the river crossings and in-water equipment discussed in the original NOP remain part of the Project, but that the following additions and deletions have been made to the Project proposal:

- Addition of a water diversion intake and associated equipment at Tembladero Slough;
- Addition of CalAm's water distribution pipelines; and
- Removal of the proposed coastal injection wells and recharge facilities.

**Environmental Review**

CSLC staff reviewed the May 2013 NOP and provided comments in a letter dated June 27, 2013 (enclosed). Although the Supplemental NOP discusses the above-mentioned Project changes, the comments submitted by CSLC staff in June 2013 are still applicable to Project activities that may occur on sovereign land. Please refer to the June 2013 letter for specific comments on the NOP.

Thank you for the opportunity to comment on the Supplemental NOP for the Project. As a trustee and responsible agency, the CSLC staff requests that you consult with us on this Project and keep us advised of changes to the Project description and all other important developments. Please send additional information on the Project to the CSLC staff listed below as the EIR is being prepared.

Please refer questions concerning environmental review to Holly Wyer, Environmental Scientist, at (916) 574-2399 or via e-mail at Holly.Wyer@slc.ca.gov. For questions concerning CSLC leasing jurisdiction, please contact Drew Simpkin, Public Land Management Specialist, at (916) 574-2275, or via email at Drew.Simpkin@slc.ca.gov.

Sincerely,

Cy R. Oggins, Chief
Division of Environmental Planning
and Management

**Subject: Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Monterey Peninsula Groundwater Replenishment Project, Monterey County**

Dear Mr. Holden:

The California State Lands Commission (CSLC) staff has reviewed the subject NOP for the Monterey Peninsula Groundwater Replenishment Project (Project), which is being prepared by the Monterey Regional Water Pollution Control Agency (MRWPCA). MRWPCA, as a public agency proposing to carry out a project, is the lead agency under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.). The CSLC is a trustee agency because of its trust responsibility for projects that could directly or indirectly affect sovereign lands, their accompanying Public Trust resources or uses, and the public easement in navigable waters. Additionally, if the Project involves work on sovereign lands, the CSLC will act as a responsible agency.

**<u>CSLC Jurisdiction and Public Trust Lands</u>**

The CSLC has jurisdiction and management authority over all ungranted tidelands, submerged lands, and the beds of navigable lakes and waterways. The CSLC also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions (Pub. Resources Code, §§ 6301, 6306). All tidelands and submerged lands, granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the Common Law Public Trust.

As general background, the State of California acquired sovereign ownership of all tidelands and submerged lands and beds of navigable lakes and waterways upon its admission to the United States in 1850. The State holds these lands for the benefit of all people of the State for statewide Public Trust purposes, which include but are not limited to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space. On navigable non-tidal waterways, including lakes, the State holds fee ownership of the bed of the waterway landward to the ordinary low water mark and a Public Trust easement landward to the ordinary high water mark, except where the boundary has been fixed by agreement or a court. Such boundaries may not be readily apparent from present day site inspections.

In order to determine the CSLC's leasing interest, if any, in the proposed Project, please provide more detailed maps showing the exact locations of all pipelines or other proposed improvements crossing the Salinas River. In addition, should any deep injection or shallow wells be located within the Salinas River or Monterey Bay, please provide CSLC staff with the exact locations as soon as they are known.

**Project Description**

The MRWPCA proposes to produce and deliver high quality treated water for replenishment of the Seaside Basin to meet the Agency's and California American Water Company's (Cal-Am's) objectives and needs as follows:

- Reduce Water Diversions. Cal-Am has been ordered by the State Water Resources Control Board to reduce its diversions from the Carmel River to 3,376 AFY by 2017. The proposed Project will supply 3,500 AFY of replacement water to Cal-Am and reduce diversions from the Carmel River by the same amount;
- Provide a Cost-Effective Water Source. The Project should be capable of supplying reasonably-priced water;
- Regulatory Compliance. The Project should be capable of complying with water quality regulations intended to protect public health; and
- Additional Objectives. The Project should also assist in preventing seawater intrusion into the Seaside Basin, diversifying Monterey County's water supply portfolio, and provide additional water that could be used for crop irrigation.

From the Project Description, CSLC staff understands that the Project would include the following components:

- Source Water Conveyance Facilities. Diversion and collection facilities, including pipelines and pump stations to convey source water to the new treatment facilities;
- Treatment Facilities. Pretreatment facilities, a new Advanced Water Treatment Plant, and associated facilities at the Regional Treatment Plant site to filter and treat the source water;
- Product Water Conveyance Facilities. Pipelines, pump stations, appurtenant facilities along one of two optional alignments to convey the treated water to the Seaside Basin; and
- Replenishment and Recharge Facilities. Pipelines, deep injection and shallow (vadose zone) wells, and backflush facilities to be located at one or both of two optional recharge site (coastal and inland) within the Seaside Basin Boundaries.

**Environmental Review**

CSLC staff requests that the following potential impacts be analyzed in the EIR.

General Comments

1. Project Description: A thorough and complete Project Description should be included in the EIR in order to facilitate meaningful environmental review of potential impacts, mitigation measures, and alternatives. The Project Description should be as precise as possible in describing the details of all allowable activities (e.g., types of equipment or methods that may be used, maximum area of impact or volume of sediment removed or disturbed, seasonal work windows, locations for material disposal, etc.), as well as the details of the timing and length of activities. Thorough descriptions will facilitate CSLC staff's determination of the extent and locations of its leasing jurisdiction, make for a more robust analysis of the work that may be performed, and minimize the potential for subsequent environmental analysis to be required.

Biological Resources

2. Sensitive Species: The EIR should disclose and analyze all potentially significant effects on sensitive species and habitats in and around the Project area, including special-status wildlife, fish, and plants, and if appropriate, identify feasible mitigation measures to reduce those impacts. The MRWPCA should conduct queries of the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and U.S. Fish and Wildlife Service's (USFWS) Special Status Species Database to identify any special-status plant or wildlife species that may occur in the Project area. The EIR should also include a discussion of the MRWPCA's consultation with CDFW and USFWS, including any recommended mitigation measures and potentially required permits identified by these agencies.

3. Invasive Species: One of the major stressors in California waterways is introduced species. In light of the recent decline of native pelagic organisms and in order to protect at-risk fish species, the EIR should examine if any elements of the Project (e.g., changes in amount and timing of freshwater flow) would favor non-native fisheries within the Salinas River. The CDFW's Invasive Species Program could assist with this analysis as well as with the development of appropriate mitigation (information at http://www.dfg.ca.gov/invasives/)

4. Construction Noise: The EIR should also evaluate noise and vibration impacts on fish and birds from directional drilling of the pipelines and for associated land-side activity. Mitigation measures could include species-specific work windows as defined by CDFW, USFWS, and the National Oceanic and Atmospheric Administration's Fisheries Service (NOAA Fisheries). Again, staff recommends early consultation with these agencies to minimize the impacts of the Project on sensitive species.

5. Frac-Out: If directional drilling will occur under the Salinas River to lay a pipeline, the EIR should evaluate the potential for frac-out to occur during drilling and analyze the potential impacts of frac-out to biological resources, including sensitive species and habitats. If impacts are found to be significant, the EIR should identify feasible mitigation measures to reduce the impacts of frac-out. CSLC staff may request documentation of mitigation for frac-out before issuing a lease. An example of a frac-out contingency plan that generally meets the CSLC's leasing requirements is the Contingency and Resource Protection Plan developed for the Construction of the AT&T Fiber Optic Cable Installation Project, Las Vegas to Victorville FTB Clark County, Nevada, and San Bernardino Counties, which is available at http://www.slc.ca.gov/division_pages/DEPM/DEPM_Programs_and_Reports/ATT_Fiber_Optic/PDF/Appendices/Ap-I_HDD_Plan.pdf.

Climate Change

6. Greenhouse Gases: A greenhouse gas (GHG) emissions analysis consistent with the California Global Warming Solutions Act (AB 32) and required by the State CEQA Guidelines[1] should be included in the EIR. This analysis should identify a threshold for significance for GHG emissions, calculate the level of GHGs that will be emitted as a result of construction and ultimate build-out of the Project, determine the significance of the impacts of those emissions, and, if impacts are significant, identify mitigation measures that would reduce them to less than significant.

7. Sea Level Rise: The EIR should also consider the effects of sea level rise on all resource categories potentially affected by the proposed Project. One of the Project's objectives is to prevent saltwater intrusion into groundwater basins. Since the EIR's impacts analysis will be used to develop a range of alternatives to the Project, please consider how sea level rise may increase or accelerate saltwater intrusion into the Project's groundwater basins and determine the Project's resiliency to sea level rise. If sea level rise is found to reduce the Project's effectiveness and impact CEQA resource categories, consider creating an alternative to the Project that would be more resilient to sea level rise.

   At its meeting on December 17, 2009, the CSLC approved the recommendations made in a previously requested staff report, "A Report on Sea Level Rise Preparedness" (Report), which assessed the degree to which the CSLC's grantees and lessees have considered the eventual effects of sea level rise on facilities located within the CSLC's jurisdiction. (The Report can be found on the CSLC's website, www.slc.ca.gov.) One of the Report's recommendations directs CSLC staff to consider the effects of sea level rise on hydrology, soils, geology, transportation, recreation, and other resource categories in all environmental determinations associated with CSLC leases.

[1] The State "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Please note that, when considering lease applications, CSLC staff is directed to (1) request information from applicants concerning the potential effects of sea level rise on their proposed projects, (2) if applicable, require applicants to indicate how they plan to address sea level rise and what adaptation strategies are planned during the projected life of their projects, and (3) where appropriate, recommend project modifications that would eliminate or reduce potentially adverse impacts from sea level rise, including adverse impacts on public access.

Cultural Resources

8. Submerged Resources: The EIR should evaluate potential impacts to submerged cultural resources in the Project area, including the Salinas River. The CSLC maintains a shipwrecks database that can assist with this analysis.. CSLC staff requests that the MRWPCA contact Senior Staff Counsel Pam Griggs (see contact information below) to obtain shipwrecks data from the database and CSLC records for the Project site. The database includes known and potential vessels located on the State's tide and submerged lands; however, the locations of many shipwrecks remain unknown. Please note that any submerged archaeological site or submerged historic resource that has remained in State waters for more than 50 years is presumed to be significant.

9. Title to Resources: The EIR should also mention that the title to all abandoned shipwrecks, archaeological sites, and historic or cultural resources on or in the tide and submerged lands of California is vested in the State and under the jurisdiction of the CSLC. CSLC staff requests that the MRWPCA consult with Senior Staff Counsel Pam Griggs (see contact information below), should any cultural resources on state lands be discovered during construction of the proposed Project.

Additional Review

10. Deferred Mitigation: In order to avoid the improper deferral of mitigation, mitigation measures should either be presented as specific, feasible, enforceable obligations, or should be presented as formulas containing "performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way" (State CEQA Guidelines, §15126.4, subd. (b)).

Thank you for the opportunity to comment on the NOP for the Project. As a responsible agency, the CSLC will need to rely on the Final EIR for the issuance of any amended or new lease as specified above and, therefore, we request that you consider our comments during development of the EIR. Please send additional information on the Project to the CSLC as plans become finalized.

Please send copies of future Project-related documents, including electronic copies of the Draft and Final EIR, Mitigation Monitoring and Reporting Program (MMRP), Notice of Determination (NOD), CEQA Findings and, if applicable, Statement of Overriding Considerations when they become available, and refer questions concerning environmental review to Holly Wyer, Environmental Scientist, at (916) 574-2399 or via e-mail at Holly.Wyer@slc.ca.gov. For questions concerning archaeological or historic resources under CSLC jurisdiction, please contact Senior Staff Counsel Pam Griggs at (916) 574-1854 or via email at Pamela.Griggs@slc.ca.gov. For questions concerning CSLC leasing jurisdiction, please contact Drew Simpkin, Public Land Management Specialist, at (916) 574-2275, or via email at Drew.Simpkin@slc.ca.gov.

Sincerely,

Cy R. Oggins, Chief
Division of Environmental Planning
and Management

**Subject: NOP for Supplement to May 2013 Notice of Preparation of an EIR for the Pure Water Monterey Groundwater Replenishment Project**

Dear Mr. Holden,

This letter transmits comments for the proposed subject project. The City of Seaside respectfully requests that the following comments be considered for incorporation into the environmental documents.

1) The proposed monitoring wells will be relocated, if necessary and at the owner's expense, as soon as the City has approved development plans for the area. The monitoring wells shall be relocated to be within a proposed future public right of way or an accessible public area.

2) The proposed monitoring wells should not include any above grade features.

3) Proposed above grade features, such as injection well appurtenances, shall be screened to minimize visual impacts.

4) The proposed backwash pits should be designed to minimize visual impacts.

5) In the event that new underground piping is required, the City requests that the same route be used as for the proposed Cal-Am Monterey Peninsula Water Supply Project.

6) MRWPCA shall coordinate with Cal-Am on work within the public right of way within the City of Seaside, such as pipeline installation, so that all work is performed concurrently with Cal-Am.

7) To the greatest extent possible, locate the facilities within the City of Seaside that cannot be located within a public right of way to areas classified as the Utility Corridor or Borderlands under the Habitat Management Plan.

We look forward to working with your staff to complete the proposed project in a timely manner. You may contact me or Rick Riedl of my staff at 831-899-6825 or RRiedl@ci.seaside.ca.us to discuss any questions or comments.

Sincerely,

Tim O'Halloran

# MEMORANDUM

| | | | |
|---|---|---|---|
| TO: | Bob Holden, MRWPCA<br>Larry Hampson, MPWMD | DATE: | March 26, 2015<br>Updated Sept. 23, 2015 |
| CC: | Alison Imamura, Denise Duffy & Assoc. | | |
| FROM: | Andrew Sterbenz, PE | JOB #: | MRWP.01.14 |
| SUBJECT: | Pure Water Monterey Groundwater Replenishment Project – Proposed Source Water Availability, Yield, and Use | | |

The purpose of this memorandum is to summarize the source water availability and yield estimates for the Pure Water Monterey Groundwater Replenishment Project (Proposed Project), to explain the seasonal storage yield estimates, and to provide the proposed maximum and typical (or normal) water use estimates for the Proposed Project. The Proposed Project will develop various source waters and convey them to the MRWPCA Regional Treatment Plant (RTP) where they will undergo primary and secondary treatment with the current municipal wastewater flows, and then undergo Advanced Water Treatment before being conveyed for injection in the Seaside Groundwater Basin. Source waters conveyed to the RTP which are not required for injection into the Seaside Basin will undergo tertiary treatment at the Salinas Valley Reclamation Plant (SVRP) and be used to increase the recycled water supply provided to the Castroville Seawater Intrusion Project (CSIP).

A number of technical documents were prepared to analyze and confirm available source supplies for the Proposed Project. Source waters for the Proposed Project include new surface water diversions, agricultural wash water, urban stormwater runoff and unused secondary-treated effluent from the RTP which would otherwise be discharged to the ocean as further described, below. The source water availability studies that have been used as the basis for estimating yield are cited throughout this report. These reports and studies include:

1. Schaaf & Wheeler, Reclamation Ditch Yield Study, March 2015
2. Schaaf & Wheeler, Blanco Drain Yield Study, December 2014
3. Data on Source Water Estimates provided by Bob Holden, MRWPCA, February 2014
4. Todd Groundwater, *Memorandum: Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River,* February 2015
5. Schaaf & Wheeler, *Groundwater Replenishment Project, Salinas River Inflow Impacts,* February 2015
6. Schaaf & Wheeler, *Groundwater Replenishment Project, Urban Runoff Capture at Lake El Estero,* April 2014
7. Data from *Monterey County Water Recycling Projects/Salinas Valley Water Project/Salinas River Diversion Facility Update,* MCWRA Board Packet, February 24, 2014

Among the Proposed Project's objectives is to provide high quality replacement water to allow California American Water Company (CalAm) to extract 3,500 acre-feet per year (AFY) more water from the

Seaside Basin for delivery to its customers in the Monterey District service area and reduce Carmel River system water use by an equivalent amount. To meet this objective, the Proposed Project would include features that would create a reliable source of water supply by using source waters described below to produce purified recycled water using existing secondary treatment processes and a new Advanced Water Treatment (AWT) Facility at the MRWPCA Regional Treatment Plant. After treatment by the AWT Facility, the purified recycled water would be conveyed to the Seaside Groundwater Basin for subsurface injection using a series of shallow and deep wells. In the Seaside Groundwater Basin, the treated water would mix with the groundwater present in the aquifers and be stored for future urban use. CalAm would use existing wells and improved potable water supply distribution facilities to extract and distribute the water produced by the Proposed Project, enabling CalAm to reduce its diversions from the Carmel River system by this same amount.

Another purpose of the Proposed Project is to provide additional water to the Regional Treatment Plant that could be recycled at the existing tertiary treatment facility (the Salinas Valley Reclamation Plant) and used for crop irrigation using the CSIP system. The Salinas Valley Reclamation Plant produces tertiary-treated, disinfected recycled water for agricultural irrigation within the CSIP service area. Municipal wastewater and certain urban dry weather runoff diversions treated at the Regional Treatment Plant are currently the only sources of supply for the Salinas Valley Reclamation Plant. Municipal wastewater flows have declined in recent years due to aggressive water conservation efforts by the MRWPCA member entities. The new sources of water supply developed for the GWR Project would increase supply available at the Regional Treatment Plant for use by the Salinas Valley Reclamation Plant during the peak irrigation season (April to September). In addition, the Proposed Project would include Salinas Valley Reclamation Plant modifications to allow tertiary treatment at lower daily production rates, facilitating increased use of recycled water during the late fall, winter and early spring months when demand drops below 5 million gallons per day (MGD).

Source waters for the Proposed Project include new surface water diversions, agricultural wash water, urban stormwater runoff and unused secondary-treated effluent from the RTP which would otherwise be discharged to the ocean.

**Agricultural Wash Water**

The City of Salinas owns and operates an industrial wastewater collection and treatment system, which serves approximately 25 agricultural processing and related businesses located in the southeast corner of the City. This wastewater collection system is separate from the Salinas municipal sewage collection system. These flows, referred to as agricultural wash water, are conveyed in a network of gravity pipelines to the Salinas Industrial Wastewater Treatment Facility (SIWTF), where it is treated using aeration and disposed of using evaporation and percolation. These flows would be redirected into the municipal wastewater system for conveyance to the RTP as a source of supply for the GWR Project.

Annual inflows to the SIWTF were analyzed and a projection of year 2017 flows was prepared by the MRWPCA[1], as shown in the first row of Table 1, below. Recorded monthly inflows for calendar years 2007-2013 were tabulated and the annual averaged plotted (see Figure 1). A linear trend line was used to estimate future flows, and the projected annual average of 3.37 mgd in 2017 was used to scale the 2013 monthly inflow values. As expected, the recorded agricultural wash water flows in 2014 (included on Figure 1) fell on the trend line.

The SITWF consists of an aeration basin, three storage/percolation ponds covering 108 acres, drying beds coving 67 acres and three rapid infiltration basins covering 1.3 acres. To assess the effects of diverting

[1] Estimation by Bob Holden, MRWPCA, February 2014

flows treated at the SIWTF, Todd Groundwater[2] estimated the percentages of flows disposed as evaporation, percolation from the main ponds, and disposal through the drying beds and rapid infiltration basins (RIBs). These values are show in Table 1, below, and are used in the estimation of seasonal storage losses discussed later in this memorandum. The State Water Resources Control Board has clarified that this diversion will require a wastewater change petition for the SIWTF.

**Table 1: Agricultural Wash Water (acre-feet)**

| Source \ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |

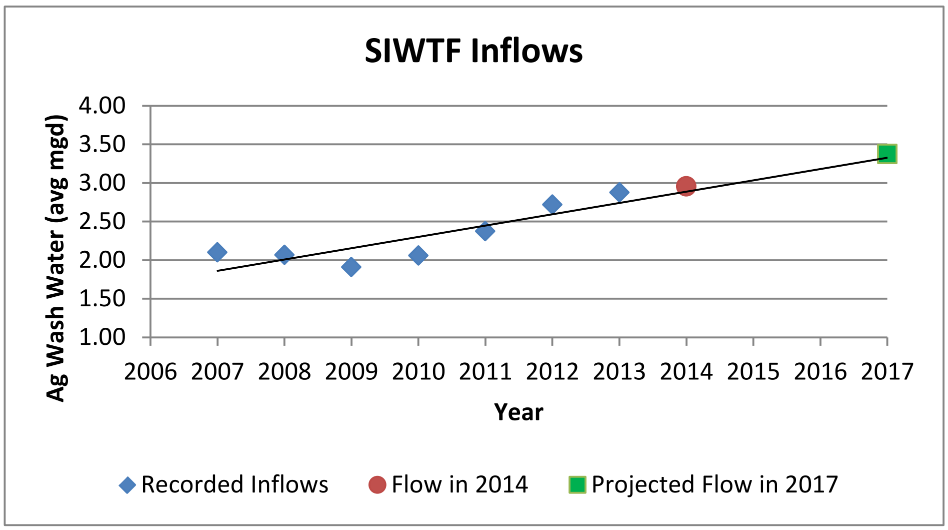
**Figure 1: Agricultural Wash Water Projection**



## Urban Stormwater Runoff

Urban stormwater runoff from two communities would be captured and used for the Proposed Project. Stormwater and urban runoff from the southern portion of the City of Salinas is pumped to the Salinas River (the rest of the City drains into the Reclamation Ditch system). Schaaf & Wheeler[3] estimated the amount of stormwater flow which could be diverted to the municipal wastewater system or the SIWTF for use in the Proposed Project. The estimated average annual yield is provided in Table 2, below.

---

[2] Todd Groundwater, *Memorandum: Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River*, February 2015

[3] Schaaf & Wheeler, *Groundwater Replenishment Project, Salinas River Inflow Impacts*, February 2015

Stormwater and urban runoff from 2,400 acres within the City of Monterey flow to Lake El Estero, which is maintained as part of El Estero Park. Excess stormwater is pumped to a discharge point on Del Monte State Beach. Schaaf & Wheeler[4] estimated the amount of stormwater flow which could be diverted to the municipal wastewater system for use in the Proposed Project. The estimated average annual yield is provided in Table 2. Diverting from Lake El Estero will require a water rights permit.

**Table 2: Urban Runoff Sources (acre-feet)**

| Source \ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| South Salinas | 52 | 41 | 34 | 16 | 2 | 0 | 0 | 0 | 2 | 8 | 23 | 47 | 225 |
| Lake El Estero | 24 | 15 | 14 | 5 | 1 | 0 | 0 | 0 | 1 | 4 | 10 | 13 | 87 |

## Surface Water Rights for Stream Flows

The Proposed Project would use three new surface water diversion sites to provide new source waters for recycling. The first two are from the Reclamation Ditch system, which has a drainage area of 157 square-miles. The Reclamation Ditch carries seasonal stormwater flows, urban runoff from the City of Salinas and agricultural tile drainage flows. Diversion points are proposed on the Reclamation Ditch at Davis Road, and on the Tembladero Slough at Castroville, based on the proximity of the channel to existing wastewater conveyance facilities. Schaaf & Wheeler[5] estimated the yield from this system, assuming a maximum 6 cfs diversion rate at Davis Road, maximum 3 cfs diversion rate at Castroville, and leaving an in-stream flow of 2 cfs at Davis Road in the winter, 0.7 cfs in the summer, and 1 cfs at Castroville year-round. The average annual yields from these diversions are shown in Table 3, below.

The third diversion is from the Blanco Drain, just above its confluence with the Salinas River. The Blanco Drain conveys seasonal stormwater flows and agricultural tile drainage from 6,400 acres. Schaaf & Wheeler[6] estimated the yield from this system, assuming a maximum diversion rate of 6 cfs, as shown in Table 3.

All of these diversions would require water rights permits from the State Water Resources Control Board (SWRCB), as would the Lake El Estero diversion discussed under Urban Stormwater Runoff.

**Table 3: Surface Water Sources (acre-feet)**

| Source \ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Reclamation Ditch | 162 | 143 | 165 | 162 | 97 | 132 | 129 | 121 | 80 | 87 | 98 | 146 | 1,522 |
| Tembladero Slough | 131 | 117 | 142 | 154 | 145 | 67 | 66 | 62 | 41 | 45 | 50 | 115 | 1,135 |
| Blanco Drain | 209 | 223 | 246 | 252 | 225 | 274 | 277 | 244 | 184 | 168 | 133 | 185 | 2,620 |

## Secondary Treated Effluent

Secondary treated municipal wastewater from the MRWPCA Regional Treatment Plant (RTP) is used as influent to the Salinas Valley Reclamation Plant (SVRP), which produces recycled water for the CSIP. Average recycled water production for the period 2009-2013 was 12,955 AFY. Average wastewater inflow to the RTP during that period was 21,764 AFY. An average of 8,809 AFY of treated wastewater in excess of what was delivered to the CSIP was discharged to the Monterey Bay through the MRWPCA's ocean outfall. The average monthly inflows and outflows from the RTP are shown in Table 4, below.

[4] Schaaf & Wheeler, *Groundwater Replenishment Project, Urban Runoff Capture at Lake El Estero,* April 2014

[5] Schaaf & Wheeler, *Reclamation Ditch Yield Study*, March 2015

[6] Schaaf & Wheeler, *Blanco Drain Yield Study*, December 2014

**Table 4: Average RTP Inflows and Outflows, 2009-2013[7] (acre-feet)**

| Source/ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **RTP Inflows** | 1,798 | 1,678 | 1,867 | 1,796 | 1,850 | 1,799 | 1,893 | 1,888 | 1,813 | 1,844 | 1,762 | 1,776 | 21,764 |
| **SVRP Deliveries** | 13 | 459 | 726 | 1,376 | 1,763 | 1,750 | 1,866 | 1,854 | 1,698 | 984 | 448 | 18 | 12,955 |
| **Ocean Outfall** | 1,785 | 1,219 | 1,141 | 420 | 88 | 49 | 27 | 34 | 114 | 859 | 1,314 | 1,759 | 8,809 |

The assumption that future CSIP recycled water demands would continue consistent with the recycled water use in this time period is considered conservative, given that this period included one drought year (2013) and that the Salinas River Diversion Facility (SRDF) operated for only four of the five years (the SRDF was not placed into operation until the year 2010).

CSIP use of all water sources are shown in Table 5, below. Under current conditions, CSIP wells are used to meet peak day demands that exceed the available recycled and river water supplies, and also to meet small demands below the lower production limit of the SVRP. The CSIP groundwater use conservatively includes one year when the SRDF didn't operate (similar to a multi-year drought condition such as occurred in 2014 and 2015).

**Table 5: Average CSIP Use by Source, 2009-2013[8] (acre-feet)**

| Source/ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **CSIP-Wells** | 448 | 195 | 304 | 412 | 324 | 606 | 519 | 504 | 300 | 75 | 233 | 352 | 4,271 |
| **SRDF-River** | 0 | 0 | 0 | 100 | 561 | 819 | 886 | 739 | 266 | 56 | 0 | 0 | 3,427 |
| **SVRP-Recycled** | 5 | 483 | 733 | 1,383 | 1,738 | 1,748 | 1,843 | 1,853 | 1,698 | 984 | 452 | 18 | 12,939 |

Note: The SVRP numerical difference between Tables 4 and 5 is due to rounding differences in the source reports.

**Proposed Project and CSIP Demands**

The Proposed Project goal is to produce 3,500 AFY of highly treated (or purified recycled) water for injection in the Seaside Groundwater Basin to allow CalAm to extract the same amount for treatment and distribution to their customers in their Monterey District service area. To produce that volume, approximately 4,320 AFY of source water inflows are required at the AWT Facility. During wet or normal water years, an additional 200 AFY may be produced and injected in the winter months to develop a drought reserve. This would require an additional 248 AFY of source water. The monthly distribution of this demand is shown in Table 6, below.

Source flows not required for the Proposed Project would be made available to create additional recycled water for the CSIP. Table 6 includes an estimate of new source flows in excess of the AWT inflow needs, assuming seasonal storage of agricultural wash water (discussed below), year-round diversion of surface water, and AWT Facility demands for a normal year building a drought reserve.

[7] Data provided by Bob Holden, MRWPCA, February 2014.

[8] Data from MCWRA *Monterey County Water Recycling Projects/Salinas Valley Water Project/Salinas River Diversion Facility Update*, February, 2014

The CSIP system distributes recycled water, Salinas River water and well water from the Salinas Valley Groundwater Basin to agricultural irrigation demands in the northern Salinas Valley. Under existing conditions, well water is used to meet peak summer demands in excess of the supply available from the other sources, and also to meet low demands below the minimum production capacity of the SVRP (currently 5 MGD). As part of the Proposed Project, the SVRP would be modified to meet recycled water demands as low as 0.5 MGD. This modification would allow the MCWRA to reduce the use of the CSIP wells, particularly in the winter months when secondary treated effluent is available. The average CSIP well use for the period 2009-2013[9] is shown in Table 6. This provides a reasonable estimate of how much additional recycled water could be used by CSIP in average year conditions.

**Table 6: Monthly GWR and CSIP Use of New Supplies (acre-feet)**

| Use \ Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Proposed Project Demand | 367 | 331 | 367 | 355 | 367 | 355 | 367 | 367 | 355 | 367 | 355 | 367 | 4,320 |
| Drought Reserve | 42 | 38 | 42 | | | | | | | 42 | 41 | 42 | 248 |

## Seasonal Storage at the SIWTF

To maximize the available supply during the peak irrigation months, the main ponds at the SIWTF would be used for seasonal storage of agricultural wash water and Salinas' urban stormwater. The analysis of source water yield and proposed diversions assumes that during the months of October through March, these flows would be directed to the SIWTF. In addition, for the source water assumptions, the use of the drying beds and infiltration basins would be discontinued, so the only losses would be evaporation and percolation from the main ponds. During the months of April through September, these flows would be diverted to the municipal wastewater collection system for recycling and injection into the Seaside Basin and tertiary treatment for CSIP. Stored water would also be pumped from the SIWTF ponds to the municipal wastewater collection system.

## Results of Source Water Availability Analysis

In the attached Table 7: Source Water Analysis, the existing inflows to the RTP are entered in the top line under Sources. The monthly storage balance in the SIWTF ponds is calculated for a normal water year. The inflow, rainfall, evaporation and percolation from Table 1 are shown in rows 1, 3, 4 and 5, respectively. Urban Runoff from South Salinas is carried from Table 2 into line 2. Assuming the ponds are empty at the start of October, they would remain wet for nine months a year, maintaining the operational characteristics of the SIWTF and enabling continued contributions of seepage water to Salinas River flows and recharge to the Salinas Valley Groundwater Basin[11]. The net yield of agricultural wash water and Salinas stormwater for the Proposed Project is shown on line 8. Other source flows from Tables 2 and 3 are shown on lines 9 through 12, and the net new supply is shown on line 13. Under the Demands heading are included the average SVRP deliveries to the CSIP and the average groundwater use by the CSIP, as well as the AWT Facility feed-water demands. Line 21 shows the projected net supply to

---

[9] Data from *Monterey County Water Recycling Projects/Salinas Valley Water Project/Salinas River Diversion Facility Update,* MCWRA Board Packet, February 24, 2014

[10] Excess supplies are calculated as the total of new water conveyed to the RTP (not including secondary treated effluent) minus the AWT Facility demand

[11] Full diversion of flows was analyzed in the report: *Groundwater Replenishment Project, Salinas River Inflow Impacts*

the CSIP (sum of existing and augmented flows), and Line 26 shows the supply for the Proposed Project while developing a drought reserve. Assuming the agencies divert all of the water shown on this table (i..e, under an assumption that the Proposed Project would divert the maximum available source waters), there would still be approximately 6,300 AFY of secondary-treated municipal wastewater discharged through the ocean outfall (line 28) during normal rainfall years.

**Diversion and Use Scenarios**

The MRWPCA has a goal of reusing 100% of the secondary treated municipal effluent at the RTP (i.e., having no discharge to the ocean), and operating the system as efficiently as possible to reduce the energy demand. Therefore, rather than divert all waters as described in the last section and in Table 7, the Proposed Project would prioritize the use of secondary treated effluent above the diversion of surface water sources, to the extent possible, which would minimize adverse environmental impacts and maximize system efficiency. The proposed priority of source usage would be:

1. Unused secondary treated effluent
2. Agricultural wash water
3. Salinas storm water
4. Reclamation Ditch
5. Blanco Drain
6. Tembladero Slough
7. Lake El Estero

In the attached scenario tables (Tables 8 through 10), the use of the various sources is reduced to just meet the demands of the AWT Facility and offset the current CSIP groundwater use in the wet season (OCT-MAR). During the dry season (APR-SEP), surface water diversions are shown meeting the monthly AWT Facility demands and providing extra flow for the CSIP, such that the annual use of new sources exceeds the annual AWT Facility demands. In practice, the surface water diversions could be reduced or increased based on the actual CSIP system demands, up to the total yields shown in Table 7. The demand scenarios considered are:

Table 8: A normal water year while developing a drought reserve (AWT Facility producing 3,700 AFY)
Table 9: A normal water year with a full drought reserve (AWT Facility producing 3,500 AFY)
Table 10: A drought year starting with a full reserve (AWT Facility producing 2,700 AFY)

In the normal year with a full reserve scenario, surface water diversions were only required from the Reclamation Ditch and the Blanco Drain. Surface water diversions were only required between April and October in both normal year scenarios.

In the drought year scenario, the stormwater and wastewater availability were reduced. Urban runoff from Salinas was assumed to be one-third of the historic average. Rainfall on the SIWTF ponds used the 2013 rainfall record (critically dry year). The unused secondary treated effluent values from 2013 were used, also the historic low. The CSIP groundwater well use from OCT 2013 to SEP 2014 was used as the CSIP augmentation target. Under this scenario, surface water diversions were required from the Reclamation Ditch, Blanco Drain and Tembladero Slough, and the diversions were needed from March through November.

**Notes**

1 Presumes all facilities associated with diversions are completed.

2 Table 2-1, p. 5, Schaaf & Wheeler Consulting Engineers. Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

5 Rainfall from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Draft Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid. Also confirmed in MPWMD Industrial Ponds Percolation and Evaporation Technical Memorandum 2015-01, July 2015.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Max diversion = 6 cfs diversion. See REVISED DRAFT BLANCO DRAIN YIELD STUDY, Schaaf and Wheeler, December 2014.

10 Max. diversion = 6 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Note that flow figures shown here are a combination of flow estimates in the S&W analysis made for the 2 cfs instream requirement Jan-May and 1 cfs instream requirement for June-Dec.

11 Max. diversion = 3 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Figures shown here are the difference between the combined Davis Road/TS diverison with Seasonal Bypass. This presumes the preference is to remove flow at Davis Road first, rather than bypass flow to Tembaldero Slough.

12 Unused secondary effluent waste water currently discharged to Monterey Bay would be used in conjunction with improvements at the RTP to provide additional flow to the Salinas Valley Reclamation Project (SVRP) during periods of low demand (i.e., < 5 mgd).

13 New source waters not used by AWT in the summer months will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by MRWPCA).

16 Secondary treated municpal effluent not used for SVRP/CSIP or the AWT.

17 Excess is calculated as Line 13 minus Line 23

**Notes**

1 Presumes all facilities associated with diversions are completed.

2 Table 2-1, p. 5, Schaaf & Wheeler Consulting Engineers. Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

5 Rainfall from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Draft Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid. Also confirmed in MPWMD Industrial Ponds Percolation and Evaporation Technical Memorandum 2015-01, July 2015.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Max diversion = 6 cfs diversion. See REVISED DRAFT BLANCO DRAIN YIELD STUDY, Schaaf and Wheeler, December 2014.

10 Max. diversion = 6 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Note that flow figures shown here are a combination of flow estimates in the S&W analysis made for the 2 cfs instream requirement Jan-May and 1 cfs instream requirement for June-Dec.

11 Max. diversion = 3 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Figures shown here are the difference between the combined Davis Road/TS diverison with Seasonal Bypass. This presumes the preference is to remove flow at Davis Road first, rather than bypass flow to Tembaldero Slough.

12 Unused secondary effluent waste water currently discharged to Monterey Bay would be used in conjunction with improvements at the RTP to provide additional flow to the Salinas Valley Reclamation Project (SVRP) during periods of low demand (i.e., < 5 mgd).

13 New source waters not used by AWT in the summer months will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by MRWPCA).

16 Secondary treated municpal effluent not used for SVRP/CSIP or the AWT.

17 Excess is calculated as Line 13 minus Line 23

## Table 9: Source Water Analysis for the Pure Water Monterey Groundwater Replenishment Project

**Notes**

1 Presumes all facilities associated with diversions are completed.

2 Table 2-1, p. 5, Schaaf & Wheeler Consulting Engineers. Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

5 Rainfall from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Draft Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid. Also confirmed in MPWMD Industrial Ponds Percolation and Evaporation Technical Memorandum 2015-01, July 2015.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Max diversion = 6 cfs diversion. See REVISED DRAFT BLANCO DRAIN YIELD STUDY, Schaaf and Wheeler, December 2014.

10 Max. diversion = 6 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Note that flow figures shown here are a combination of flow estimates in the S&W analysis made for the 2 cfs instream requirement Jan-May and 1 cfs instream requirement for June-Dec.

11 Max. diversion = 3 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Figures shown here are the difference between the combined Davis Road/TS diverison with Seasonal Bypass. This presumes the preference is to remove flow at Davis Road first, rather than bypass flow to Tembaldero Slough.

12 Unused secondary effluent waste water currently discharged to Monterey Bay would be used in conjunction with improvements at the RTP to provide additional flow to the Salinas Valley Reclamation Project (SVRP) during periods of low demand (i.e., < 5 mgd).

13 New source waters not used by AWT in the summer months will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by MRWPCA).

16 Secondary treated municpal effluent not used for SVRP/CSIP or the AWT.

17 Excess is calculated as Line 13 minus Line 23

**Notes**

1 Presumes all facilities associated with diversions are completed.

2 Table 2-1, p. 5, Schaaf & Wheeler Consulting Engineers. Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Assume dry year at 1/3 the average monthly values from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015.

5 Rainfall from Revised Draft, Groundwater Replenishment Project, Salinas River Inflow Impacts, Prepared for Denise Duffy & Associates, February 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Draft Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid. Also confirmed in MPWMD Industrial Ponds Percolation and Evaporation Technical Memorandum 2015-01, July 2015.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Max diversion = 6 cfs diversion. See REVISED DRAFT BLANCO DRAIN YIELD STUDY, Schaaf and Wheeler, December 2014.

10 Max. diversion = 6 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Note that flow figures shown here are a combination of flow estimates in the S&W analysis made for the 2 cfs instream requirement Jan-May and 1 cfs instream requirement for June-Dec.

11 Max. diversion = 3 cfs. See REVISED DRAFT RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015. Figures shown here are the difference between the combined Davis Road/TS diversion with Seasonal Bypass. This presumes the preference is to remove flow at Davis Road first, rather than bypass flow to Tembaldero Slough.

12 Unused secondary effluent waste water currently discharged to Monterey Bay would be used in conjunction with improvements at the RTP to provide additional flow to the Salinas Valley Reclamation Project (SVRP) during periods of low demand (i.e., < 5 mgd).

13 New source waters not used by AWT in the summer months will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Monthly RTP discharge during critically dry year (2013), reported by MRWPCA

16 Secondary treated municpal effluent not used for SVRP/CSIP or the AWT.

17 Excess is calculated as Line 13 minus Line 23

RE: ***Pure Water Monterey Groundwater Replenishment Project: Amended Water Rights Analysis***

## Introduction

The Proposed Groundwater Replenishment Project (the Proposed Project) consists of two components: the Pure Water Monterey Groundwater Replenishment improvements and operations that will develop high-quality replacement water for existing urban supplies, and an enhanced agricultural irrigation component.

The Proposed Project would recycle and reuse water from a number of sources, including:

A. Municipal wastewater,
B. Industrial wastewater (agricultural wash water),
C. Urban stormwater runoff, and
D. Surface water diversions.

Below is an analysis of each water source, including the legal framework and current status of water rights for each source. A summary chart is included at the end.

## A. Municipal Wastewater Collection and Treatment System

### 1. Brief Description of Project Use

The Monterey Regional Water Pollution Control Agency (MRWPCA) collects municipal wastewater from communities in northern Monterey County and treats it at its Regional Wastewater Treatment Plant (Regional Treatment Plant). Most of the wastewater is recycled for crop irrigation at an onsite tertiary treatment plant called the Salinas Valley Reclamation Plant. The tertiary-treated wastewater is delivered to growers through a conveyance and irrigation system called the Castroville Seawater Intrusion Project. The treated wastewater that is not recycled for crop irrigation is discharged to the ocean through MRWPCA's existing ocean outfall. The Proposed Project would include improvements that would enable more of the municipal wastewater to be recycled than is possible today; thus, less municipal wastewater would be discharged through the ocean outfall.

### 2. *Legal Framework*

Unless otherwise provided by agreement, the owner of a wastewater treatment plant has the exclusive right to the treated wastewater it produces as against anyone who has supplied the water discharged into the wastewater collection and treatment system, including a person using water under a service contract.[1] MRWPCA therefore has the exclusive right to use municipal wastewater that is discharged into its collection system, except as that right has been varied by contractual arrangements.[2]

Here, MRWPCA has entered into a number of relevant contracts, including contracts that assigned rights to Marina Coast Water District and Monterey County Water Resources Agency (Water Resources Agency). We understand MRWPCA has entered into the following:

- The 1989 Annexation Agreement between MRWPCA and the Marina Coast Water District provides the Marina Coast Water District with the right to obtain treated wastewater from MRWPCA. The Marina Coast Water District has not exercised its recycled water rights, but may do so in the future.

- The 1992 agreement between MRWPCA and Water Resources Agency (including amendments) (1992 Agreement) provides for the construction and operation of the Salinas Valley Reclamation Plant by MRWPCA to provide water treated to a level adequate for agricultural irrigation for use by the Castroville Seawater Intrusion Project. In particular, Section 3.03 of the 1992 Agreement (Amendment 3) provides that MRWPCA commits all of its incoming wastewater flows to the treatment plant from sources within the 2001 MRWPCA service area, up to 29.6 million gallons per day, except for flows taken by the Marina Coast Water District under the Annexation Agreements, losses, flows not needed to meet the Water Resource Agency's authorized demand, and flows to which MRWPCA is otherwise entitled under the agreement.

- In 1996, pursuant to another Annexation Agreement, the Marina Coast Water District received the right to tertiary-treated water from the Salinas Valley Reclamation Plant, in satisfaction of the 1989 agreement rights.

- In 2009, the Marina Coast Water District and MRWPCA entered into a Memorandum of Understanding relating to the Regional Urban Water Augmentation Agreement (RUWAP MOU). In the RUWAP MOU, the MRWPCA assigned a portion of its allotment from the Amendment 3 of the 1992 Agreement between MRWPCA and Monterey County Water Resources Agency. MRWPCA agreed to, among other things, provide 650 AFY of

[1] Cal. Water Code § 1210.
[2] California Water Code § 1211 requires the owner of a wastewater treatment plant to obtain approval of the State Board for a change in the point of discharge of treated wastewater when the proposed change would result in decreased flow in any portion of a watercourse. The proposed diversion of municipal wastewater from the Regional Treatment Plant from communities in northern Monterey County would not impact the flows in a watercourse; thus, approval from the State Board for this proposed diversion would not be needed.

recycled waters during the months of May through August each year from MRWPCA entitlements.[3] Marina Coast Water District agreed to commit 300 AFY of recycled water during the months of April through September from Marina Coast Water District's entitlements. Currently, Marina Coast Water District does not have approved funding, water purchase/user agreements, or adequate physical distribution facilities to use the recycled water; thus Marina Coast Water District's water right to recycled water from the RUWAP MOU have not been triggered.

To address certain water rights, the stakeholder agencies entered into a Memorandum of Understanding (Source Waters MOU). The Source Waters MOU reaffirmed the Marina Coast Water District's and Water Resources Agency's recycled water entitlements, and presented a proposal for collection of additional source waters to meet the Proposed Project objectives.

Importantly, the Source Waters MOU is intended to provide a framework for negotiation of a Definitive Agreement and does not create a binding contractual obligation. The Definitive Agreement would establish the contractual rights and obligations of the parties. To date, the Definitive Agreement has not yet been completed. If a Definitive Agreement is reached, it would be approved after the EIR is certified.

### 3. *Status of Water Rights*

Because the Source Waters MOU is not binding, it is not sufficient to secure the water rights at this time. Any outstanding water rights would need to be addressed and resolved in the forthcoming Definitive Agreement. Until then, the existing agreements with the Marina Coast Water District could impact the source water for the Proposed Project. Although the Definitive Agreement is needed to secure certain water rights, the Source Waters MOU demonstrates a reasonable likelihood that rights to that this source of water can be obtained from stakeholders that send wastewater at the Regional Treatment Facility.

## B. Salinas Agricultural Wash Water System

### 1. *Brief Description of Project Use*

Water from the City of Salinas agricultural industries, 80% to 90% of which is water used for washing produce, is currently conveyed to ponds at the Salinas Industrial Wastewater Treatment Facility for treatment (aeration) and disposal by evaporation and percolation. The Proposed Project would include improvements that would enable the agricultural wash water to be conveyed to the Regional Treatment Plant to be recycled. The Proposed Project also includes improvements at the Salinas Industrial Wastewater Treatment Facility to allow storage of

---

[3] Certain parties have disputed the validity of Amendment 3. If Amendment 3 were to be found invalid, the assignment of MRWPCA's recycled waters to Marina Coast Water District in the RUWAP MOU may also be found to be invalid. For purposes of this analysis, however, it is assumed that Amendment 3 is valid and enforceable and that Marina Coast Water District has an existing right to 650 AFY during the summer months.

agricultural wash water and south Salinas stormwater in the winter and recovery of that water for recycling and reuse in the spring, summer and fall.

### 2. *Legal Framework*

The City of Salinas has the exclusive right to the treated wastewater it collects in its system and treats at the Salinas Treatment Facility, unless modified in a contractual agreement.[4] Prior to making a change in the point of discharge of treated wastewater, the owner of a wastewater treatment plant shall obtain approval from the State Board for that change if the proposed change would result in decreased flow of any portion of a watercourse.[5] In reviewing a petition, the State Board must find that the proposed change will not injure any other legal users of water and that the change complies with the requirements of the California Fish and Game Code and the federal Endangered Species Act. The petition would also require the issuance of the EIR.

The City of Salinas thus has an exclusive right to the agricultural wash water discharged to its system, except (1) as that right has been varied by contractual arrangements or (2) to the extent the diversion of that wastewater would decrease the flow of a watercourse.

### 3. *Status of Water Rights*

Since the City of Salinas currently has the exclusive right to its treated wastewater, a contract would be needed between MRWPCA and the City of Salinas for the diversion and use of agricultural wash water. Although no agreement for the use of agricultural wash water is yet in effect, we understand that the City of Salinas has been working cooperatively with MRWPCA, demonstrating a reasonable likelihood that this source of water can be obtained.

In addition, the State Board clarified in its comments on the Draft EIR that State Board approval would be needed for diversion of wastewater that is currently discharged into percolation ponds adjacent to the Salinas River, because such diversion would reduce the flow of the Salinas River. We understand that such approval will be pursued for the diversions from the percolation ponds.

## C. Salinas Stormwater Collection System

### 1. *Brief Description of Project Use*

Stormwater from urban areas in southern portions of the City of Salinas is currently collected and released to the Salinas River through an outfall near Davis Road. The Proposed Project would include improvements that would enable Salinas Stormwater to be conveyed to the Regional Treatment Plant to be recycled.

---

[4] Cal. Water Code § 1210.
[5] Cal. Water Code § 1211(a), (b).

### 2. *Legal Framework*

To divert stormwater and dry weather flow from urban areas, agreements are needed between MRWPCA and the local agencies that currently collect and convey the flows in man-made facilities for discharge to surface waters. These local agencies include the City of Salinas for urban runoff/stormwater source water from the Salinas River. Stormwater runoff from urban areas through storm drain infrastructure (i.e., in the City of Salinas) does not become water of the state until it is discharged into a river or channel.

### 3. *Status of Water Rights*

MRWPCA would need to obtain water rights from the applicable local agencies, including the City of Salinas. We understand that there are currently no contractual arrangements or permits for diversion of stormwater or urban/agricultural runoff to the MRWPCA wastewater collection and conveyance system. However, such agreements are being pursued by MRWPCA. MRWPCA is also in the process of adjusting its connection fees and rates for discharges of stormwater and urban runoff to the wastewater collection system. We understand that the City of Salinas has been working cooperatively with MRWPCA, and agreement is reasonably likely. This demonstrates a reasonable likelihood that this source of water can be obtained.

## D. Reclamation Ditch / Tembladero Slough, Blanco Drain, and Lake El Estero Diversions

### 1. *Brief Description of Project Use*

The Reclamation Ditch is a network of excavated earthen channels used to drain natural, urban, and agricultural runoff and agricultural tile drainage. The Proposed Project would include improvements that would enable water from the Reclamation Ditch watershed to be diverted in two locations—from the Reclamation Ditch at Davis Road and from Tembladero Slough (to which the Reclamation Ditch is a tributary) near Castroville—to be conveyed to the Regional Treatment Plant to be recycled.

The Blanco Drain collects water from approximately 6,400 acres of agricultural lands near Salinas. The Proposed Project would include improvements that would enable water in the Blanco Drain to be diverted and conveyed to the Regional Treatment Plant to be recycled.

The City of Monterey actively manages the water level in Lake El Estero so that there is storage capacity for large storm events. Prior to a storm event, the lake level is lowered by pumping or gravity flow for discharge to Del Monte Beach. The Proposed Project would include improvements that would enable water that would otherwise be discharged to the beach to instead be conveyed to the Regional Treatment Plant to be recycled.

### 2. *Legal Framework*

Water that enters surface streams and rivers is considered water of the state. A water rights permit is required to impound or divert waters of the state, except for certain riparian uses. Transfer of surface water flows out of known and defined channels for recycling would be a consumptive use that may come under the jurisdiction and regulation of the State Board.

Water rights permits from the State Board would be required for surface water diversions from the Reclamation Ditch, Blanco Drain, and Tembladero Slough. In its comments on the Draft EIR, the State Board clarified that the proposed diversion from Lake El Estero would also require an appropriative right from the State Board. These source waters include agricultural return flow (overland flow and tile drainage), stormwater flow, and urban runoff. The State Board will require a completed CEQA document before issuing a permit.

In considering an application to appropriate water, the State Board considers a number of factors.[6] Specifically, the State Board considers "the relative benefit to be derived from (1) all beneficial uses of the water concerned including, but not limited to, use for domestic, irrigation, municipal, industrial, preservation and enhancement of fish and wildlife, recreational, mining and power purposes, and any uses specified to be protected in any relevant water quality control plan, and (2) the reuse or reclamation of the water sought to be appropriated, as proposed by the applicant. The State Board may subject such appropriations to such terms and conditions as in its judgment will best develop, conserve, and utilize in the public interest, the water sought to be appropriated."[7] The State Board is guided by the policy that domestic use is the highest use and irrigation is the next highest use of water.[8] The Proposed Project is consistent with these factors and it does not appear that any of the factors considered would reduce the likelihood of obtaining the necessary permits.

The Water Resources Agency submitted an application in April 2014 to the State Board to appropriate waters of the Blanco Drain, the Reclamation Ditch, and Tembladero Slough. Specifically, it applied to divert up to 25,000 acre-feet per year from each of the two water bodies at a combined rate of diversion of up to 100 cfs. On November 10, 2014, the State Water Resources Control Board sent a letter stating that staff had found the application was incomplete in several respects. In response, the Water Resources Agency submitted five separate applications on July 29, 2015, three of which are related to the Proposed Project (Application Nos. 32263A, 32263B, 32263C).[9] At the request of the State Board, the Water Resources

[6] Cal. Water Code §§ 1250 et seq.
[7] Cal. Water Code § 1257.
[8] Cal. Water Code § 1254.
[9] The remaining two applications, Application Nos. 32263D and 32263E, relate to potential future diversions by the Water Resources Agency. The Proposed Project is separate and has independent utility from these potential future diversions. Such additional waters are not needed for the Proposed Project to proceed. While these additional waters may receive tertiary treatment at the Salinas Valley Reclamation Plant, and may be distributed through the Castroville Seawater Intrusion Project (CSIP) conveyance system that would be used by the Proposed Project, these potential future diversions likely would require additional facilities for which the Water Resources Authority has not

Agency submitted amended applications with minor changes on July 29, 2015. The applications remain pending before the State Board.

The Source Waters MOU specifies that these water rights would be retained exclusively by the Water Resources Agency under the permits, but that all parties would pay pro rata costs associated with the procurement and retention of these water rights. The parties also agreed to work jointly on obtaining the needed water rights through amendments to the permit application.

In comments on the Draft EIR, the State Board clarified that an application would need to be filed to divert water from Lake El Estero in advance of a storm event. In addition, MRWPCA would need to obtain any needed agreements with the owners of the infrastructure that would be used for this diversion, such as the City of Monterey.

### 3. *Status of Water Rights*

Several steps need to be taken to secure these water rights. As a preliminary matter, the State Board would need to grant the water rights requested in Application Nos. 32263A, 32263B, 32263C. Second, the Source Waters MOU indicates that the Water Resources Agency would hold all of the rights to these waters under the Definitive Agreement associated with Application Nos. 32263A, 32263B, and 32263C, once issued. A separate agreement would therefore be necessary between the Water Resources Agency and MRWPCA to ensure that the Proposed Project has sufficient water rights associated with these applications. Therefore, these water rights are not secured yet. However, because the Water Resources Agency has submitted an application for water rights, and given the terms of the Source Waters MOU, there is a reasonable likelihood that this source of water can be obtained.

An application would also need to be filed for the diversion of the Lake El Estero diversion, should such waters be used for the Proposed Project. MRWPCA would need to obtain rights to use the infrastructure that would be used by this diversion owned by local agencies, such as the City of Monterey. It is our understanding that such rights would be pursued in due course if Lake El Estero waters would be used by the Proposed Project.

---

yet performed engineering or feasibility studies. The environmental impacts of these potential future diversions would be analyzed in a separate CEQA process.

## E. Summary Chart

| Source of Water | Status of Water Rights |
|---|---|
| Municipal Wastewater Collection and Treatment System | The MOU is not binding; the forthcoming Definitive Agreement would address and resolve competing water rights of Marina Coast Water District and Monterey County Water Resources Agency. |
| Salinas Agricultural Wash Water System | A contract is needed between MRWPCA and the City of Salinas for diversion and use of the agricultural wash water. In addition, State Board approval is needed for the diversion of the agricultural wash water away from the percolation ponds. |
| Salinas Stormwater Collection System and Lake El Estero water | Contracts are needed between MRWPCA and the applicable local agencies, including the City of Salinas. |
| Reclamation Ditch / Tembladero Slough, Blanco Drain, and Lake El Estero Diversions | State Board approval of the pending applications is needed. An additional application for the Lake El Estero diversion would need to be filed. Because the Source Waters MOU is not binding, the forthcoming Definitive Agreement would further address these water rights. The MOU suggests that the Water Resources Agency will exclusively retain the water rights under the permit, in which case a separate agreement would be needed between the Water Resources Agency and MRWPCA. |

## 1. Executive Summary

The Monterey Regional Water Pollution Control Agency (MRWPCA) is preparing an Environmental Impact Report (EIR) in accordance with the provisions of the California Environmental Quality Act (CEQA) for the proposed Pure Water Monterey Groundwater Replenishment Project (GWR Project). The GWR Project would create a reliable source of water supply by collecting a variety of new source waters that would be combined with existing incoming raw wastewater flows for conveyance to and treatment at MRWPCA's Regional Wastewater Treatment Plant (RTP). The RTP effluent not further treated to tertiary levels and used for agricultural irrigation in northern Salinas Valley would be conveyed to a new advanced water treatment facility (AWT Facility) that would produce highly-purified recycled water (purified water). The purified water would be used to replenish the Seaside Groundwater Basin (Seaside Basin) by injecting this high quality water into a series of shallow and deep injection wells. Once injected into the Seaside Basin, the purified water would mix with the groundwater present in the aquifers and be stored for future extraction from existing potable water supply wells.

The GRW Project would enable California American Water Company (CalAm) to reduce its diversions from the Carmel River system by up to 3,500 acre-feet per year (AFY) by injecting the same amount of purified water into the Seaside Basin. CalAm is under a State order to secure replacement water supplies and cease over-pumping of the Carmel River by January 2017.

The GWR Project would also result in additional tertiary recycled water supply for agricultural irrigation in northern Salinas Valley. Currently, the only sources of supply for the existing tertiary recycled water are municipal wastewater and small amounts of urban dry weather runoff.[1] Municipal wastewater flows have declined in recent years due to aggressive water conservation efforts by the MRWPCA member entities. By increasing the amount and type of source waters entering the existing wastewater collection system, additional tertiary recycled water can be provided for use in the Castroville Seawater Intrusion Project's (CSIP's) agricultural irrigation system. It is anticipated that approximately 4,750 AFY of additional recycled water supply could be created for CSIP irrigation purposes. Some modifications would be made to the water recycling facility to optimize and enhance the delivery of recycled water to growers. The tertiary recycled water complies with statutory and regulatory requirements for the production and use of recycled water per California Water Code Sections 13500 – 13577 and California Code of Regulations, Title 22, Sections 60301 – 60357.

The GWR Project would also include a drought reserve component. The GWR Project would provide for an additional 200 AFY of purified water that would be injected in the Seaside Basin in wet and normal years up to a total of 1,000 acre feet (AF). Thus, the GWR Project would inject up to 3,700 AF into the Seaside Basin in some years, rather than the 3,500 AF needed for CalAm supplies. This would result in a "banked" drought reserve. During dry years, less than 3,500 AF of GWR Project purified water would be delivered to the Seaside Basin, and the source waters that are not sent to the AWT Facility would be further treated to tertiary recycled water specification and sent to the SVRP to increase irrigation supplies for the agricultural lands. CalAm would be able to extract the banked water to make up the difference to its supplies, such that its extractions and deliveries would not fall below 3,500 AFY.

Planning for the GWR Project has included a pilot study of some of the source waters and treatment technologies intended to be part of the new AWT Facility. The proposed full-scale AWT Facility would consist of pre-treatment (using ozone, and potentially biologically activated filtration); membrane filtration (MF); reverse osmosis (RO); advanced oxidation (AOP) using ultraviolet light and hydrogen peroxide; and post-treatment stabilization. In addition, hydrogeologic modeling and soil and geochemical analyses have been performed for the GWR Project. The California State Water Resources Control Board Division of Drinking Water (DDW), the Central Coast Regional Water Quality Control Board, and a National Water Research

[1] Salinas River water is stored and used for irrigation during the period April 1 to October 31, but is not a source of supply for the tertiary treatment facility.

Institute Independent Advisory Committee have provided oversight for these studies and project planning. DDW has conditionally approved the GWR Project based on MRWPCA's proposal that presents the general concepts of the project (MRWPCA, 2014). More information must be provided as part of the Proposed Project's Engineering Report for DDW approval.

In conjunction with the EIR, this technical report was prepared to present pertinent information related to the following: (1) the status of recycled water regulations pertaining to groundwater replenishment; (2) studies of other similar projects that have assessed the effects of using recycled water for groundwater replenishment on groundwater quality and public health; (3) studies that have been specifically conducted for the project related to the AWT Facility design and performance; (4) studies that have been specifically conducted for the project regarding protection of groundwater quality and quantity; (5) GWR Project compliance with applicable statutes, policies, and regulations; (6) GWR Project effects on groundwater; and (7) the significance of this information for the EIR.

This evaluation has concluded that:

- California has established numerous state laws, regulations and policies governing the use of recycled water for groundwater replenishment to protect groundwater quality and the health of individuals who drink groundwater that is replenished using recycled water, including:
    - Comprehensive regulations for the use of purified water for replenishment of groundwater (Groundwater Replenishment Regulations);
    - State policies related to maintaining high quality water;
    - A Water Quality Control Plan (Basin Plan) implemented by the Central Coast Regional Water Quality Control Board including standards, objectives, and guidelines for the protection of groundwater quality in the GRW Project area; and
    - Effective July 1, 2014, consolidation of the regulatory structure for water, recycled water and wastewater into one agency, the State Water Resources Control Board, to protect public health and promote comprehensive protection of drinking water and other beneficial uses of the state's waters.
- Studies have been conducted for other similar potable reuse projects , including epidemiology studies, risk assessments, and investigations that analyze and compare the toxicological properties of recycled water to those of drinking water. These studies have shown:
    - There is no association between the use of recycled water and adverse health outcomes in individuals consuming groundwater containing recycled water; and
    - Purified water from an appropriately designed and operated AWT Facility presents less risk from in terms of regulated chemicals, pathogens, and trace organics compared to the risk from conventional drinking water sources.
- Based on the analytical results of monitoring the source waters to be used for the GWR Project, the water quality results of the pilot plant testing (using ozone, MF, and RO), information on the predicted performance and water quality of the proposed full-scale AWT Facility based on other existing groundwater replenishment projects and related research/studies:
    - The GWR Project would comply with the Groundwater Replenishment Regulations and would meet all Central Coast Basin Plan standards, objectives, and guidelines.
    - An Independent Advisory Panel and the State Division of Drinking Water (DDW) have reviewed the GWR Project concept. The DDW has conditionally approved the GWR Project proposal, pending submittal of additional information per the Groundwater Replenishment Regulations.

- The full-scale proposed AWT Facility and recharge of the purified water would provide reliability and redundancy through the use of multiple treatment barriers. Including the Regional Treatment Plant in combination with the AWT Facility, the integrated treatment system would achieve chemical constituent removal redundancy by employing at least two treatment processes for each constituent type and at least four treatment processes for each pathogen category, as shown in the table below.

**Proposed Groundwater Replenishment Project Treatment Barriers**

| Process | Chemical Constituents | | | | | Pathogenic Microorganisms | | |
|---|---|---|---|---|---|---|---|---|
| | Nitrogen | TOC[a] | DPBs[b] | Inorganics | CECs[c] | Bacteria | Viruses | Protozoa |
| RTP Primary/ Secondary | ✓ | ✓ | | ✓ | ✓ | ✓ | ✓ | ✓ |
| Ozone | | | ✓ | | ✓ | ✓ | ✓ | ✓ |
| MF | | ✓ | | ✓ | | ✓ | | ✓ |
| RO | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| AOP | | | ✓ | | ✓ | ✓ | ✓ | ✓ |
| Underground Residence Time | | | | | | ✓ | ✓ | ✓ |

a. Total organic carbon – TOC.
b. Disinfection by-products – DBPs.
c. Constituents of emerging concern - CECs

- To evaluate compliance with the State Recycled Water Policy, studies were conducted to (1) analyze the recharge components of the GWR Project, including recharge wells, operational facilities, and the fate and transport of the purified water in the groundwater basin, and (2) conduct geochemical modeling to test stabilized RO pilot test water[2] compatibility with ambient groundwater. The studies found that:
    - No documented groundwater contamination or contaminant plumes were identified in the GWR Project area. Therefore, injection of purified water associated with the GWR Project would not exacerbate existing groundwater contamination or cause plumes of contaminants to migrate.
    - When two water types with different water chemistry are mixed (such as the GWR Project purified water and groundwater), geochemical reactions could occur in the groundwater system that could potentially result in leaching of natural or anthropogenic constituents, which could also potentially impact groundwater quality. The risk of geochemical impacts from incompatibility would be addressed at the proposed AWT Facility by including a treatment process to ensure that the purified water is stabilized and non-corrosive. The design of the treatment stabilization process will be informed by the geochemical modeling studies.
- A Salt/Nutrient Management Plan (SNMP) has been prepared for the Seaside Basin to comply with the Recycled Water Policy. As documented in the SNMP, ambient groundwater generally exceeds the Basin Plan groundwater objective for total dissolved solids (TDS) in many areas of the Seaside Basin, while nitrate and chloride concentrations generally meet Basin Plan objectives. Studies

[2] The samples were RO permeate collected from the MRWPCA pilot plant. The RO permeate was stabilized using a bench-scale post-treatment stabilization unit to better approximate the water quality anticipated for the proposed AWT Facility.

conducted to evaluate the water quality of the stabilized RO pilot test water found that the concentrations of TDS, nitrate, and chloride in the RO water met all Basin Plan objectives. Further, these concentrations were generally lower than average concentrations in groundwater. As such, replenishment of the Seaside Basin using the GWR Project purified water would not degrade, but would provide benefits to, local groundwater quality.

- Based on the source water sampling, results of the pilot testing and hydrogeologic studies, other relevant research, and information from other groundwater replenishment projects, the following conclusions are offered with regard to the GWR Project's effect on groundwater resources:
  - The GWR Project purified water would meet groundwater quality standards in the Basin Plan and state drinking water quality standards. A monitoring program would document project performance.
  - The GWR Project purified water would contain much lower concentrations of TDS and chloride than ambient groundwater and would be expected to provide a benefit to the basin groundwater quality.
  - No documented groundwater contamination or contaminant plumes have been identified in the GWR Project area. Therefore, injection associated with the GWR Project would not exacerbate existing groundwater contamination or cause plumes of contaminants to migrate.
  - Injection of AWT Facility purified water would not degrade groundwater quality.
  - The GWR Project purified water would be stabilized as part of the AWT Facility to ensure no adverse geochemical impacts. Geochemical modeling will be used to inform the AWT Facility stabilization procedures, which can be adjusted as needed.
  - The GWR Project would result in both higher and lower water levels in wells throughout the Seaside Basin at various times. Although water levels would be slightly lower during some time periods, the difference is generally small and judged insignificant. Modeling indicates that the GWR Project would not lower water levels below protective levels in coastal wells and would not exacerbate seawater intrusion

## 2. Introduction

In accordance with the provisions of the California Environmental Quality Act (CEQA), the Monterey Regional Water Pollution Control Agency (MRWPCA), as the CEQA lead agency, is preparing an Environmental Impact Report (EIR) for the proposed Pure Water Monterey Groundwater Replenishment Project (GWR Project). The GWR Project is being proposed by MRWPCA in partnership with the Monterey Peninsula Water Management District (Water Management District). The GWR Project would create a reliable source of water supply by collecting a variety of new source waters that would be combined with existing incoming raw wastewater flows for conveyance to and treatment at MRWPCA's Regional Wastewater Treatment Plant (RTP). The RTP effluent not further treated and used for agricultural irrigation in northern Salinas Valley, as part of the Salinas Valley Reclamation Project (SVRP), would be conveyed to a new advanced water treatment facility (AWT Facility) that would produce highly-purified recycled water (purified water). The purified water would be used to replenish the Seaside Groundwater Basin (Seaside Basin) by injecting this water into a series of shallow and deep injection wells. Once injected into the Seaside Basin, the purified water would mix with the groundwater present in the aquifers and be stored for future extraction from existing potable water supply wells. The primary purpose of the GWR Project is to provide 3,500 acre-feet per year (AFY)[3] of high quality replacement water to California American Water Company (Cal-Am) for extraction and delivery to its customers in the Monterey District service area. The 3,500 AFY will enable Cal-Am to reduce its diversions from the Carmel River system by this same amount.[4] Cal-Am is under a state order to secure replacement water supplies and cease over-pumping of the Carmel River by January 2017.

The GWR Project would also provide for a drought reserve component that would provide for an additional 200 AFY of purified water to be injected in the Seaside Basin in wet and normal years up to a total of 1,000 acre feet (AF). This component would result in a "banked" drought reserve. During dry years, the GWR Project would deliver less than 3,500 AF to the Seaside Basin, and the source waters that are not sent to the AWT Facility during dry years would be sent to the SVRP to increase irrigation supplies for the agricultural lands. CalAm would be able to extract the banked water to make up the difference to its supplies, such that its extractions and deliveries would not fall below 3,500 AFY. .

Finally, the GWR Project would produce additional tertiary recycled water supply for agricultural irrigation in northern Salinas Valley. Currently, the only sources of supply for the existing water recycling facility at the Regional Treatment Plant are municipal wastewater and small amounts of urban dry weather runoff.[5] Municipal wastewater flows have declined in recent years due to aggressive water conservation efforts by the MRWPCA member entities. By increasing the amount and type of source waters entering the existing wastewater collection system, additional recycled water can be provided for use in the Castroville Seawater Intrusion Project's (CSIP) agricultural irrigation system. It is anticipated that approximately 4,750 AFY of additional recycled water supply could be created for CSIP irrigation purposes. Some modifications would be made to the water recycling facility to optimize and enhance the delivery of recycled water to growers. The tertiary recycled water complies with statutory and regulatory requirements for the production and use of recycled water per California Water Code (CWC) Sections 13500 – 13577 and California Code of Regulations (CCR), Title 22, Sections 60301 – 60357, and is regulated under Central Coast Regional Water Quality Control Board (RWQCB) Order No. 94-82.

MRWPCA currently operates the RTP that includes primary and secondary treatment, a tertiary water recycling facility (the SVRP), a non-potable water distribution system (CSIP), sewage collection pipelines, wastewater pump stations, and an ocean outfall. The RTP has a permitted design capacity to treat 29.6 million gallons per day (mgd) of wastewater; it currently treats approximately 17 to 18 mgd. At the RTP,

[3] An acre-foot (AF) is enough water to flood one-acre (which is approximately the size of a football field) to be 1 foot deep (325,861 gallons). A family of five on the Monterey Peninsula typically uses about 0.5 AFY.

[4] Cal-Am is an investor-owned public utility that serves approximately 38,500 customers in the Monterey Peninsula area.

[5] Salinas River water is stored and used for irrigation during the period April 1 to October 31, but is not a source of supply for the tertiary treatment facility.

wastewater is treated to two different standards: (1) recycled water that meets criteria in CCR Title 22 for unrestricted use of recycled water for agricultural irrigation (tertiary filtration and disinfection), and (2) primary and secondary treatment for discharge through the ocean outfall that meets standards in the California Ocean Plan. Disinfected tertiary recycled water is distributed to nearly 12,000 acres of farmland in the northern Salinas Valley for irrigation. While the RTP predominantly treats municipal wastewater, it also accepts some dry weather urban runoff and other discrete wastewater flows.

The GWR Project includes the following components:

1. Source water diversion and storage – To produce up to 3,700 AFY of purified water for injection into the Seaside Basin and approximately, 4,750 AFY of additional CSIP irrigation water, the GWR Project requires the diversion of new source waters to the existing municipal wastewater collection system and conveyance of those waters to the existing RTP. The new source waters would originate from (1) City of Salinas agricultural wash water, (2) stormwater flows from the southwestern part of Salinas and the Lake El Estero facility in Monterey, (3) surface water and agricultural tile drain water that is captured in the Salinas Reclamation Ditch and Tembladero Slough, and (4) surface water and agricultural tile drain water that flows in the Blanco Drain.
2. Treatment facilities at the RTP – These would consist of the existing primary and secondary treatment facilities at the RTP, a new AWT Facility to produce the purified water, stabilization of water after AOP, purified water pump station, and reverse osmosis (RO) concentrate disposal facilities (that include a brine mixing facility and the existing ocean outfall). The AWT Facility will include: pre-treatment (using ozone, and potentially biologically activated filtration (BAF)); membrane filtration (MF); RO; and advanced oxidation (AOP) using ultraviolet light (UV) and hydrogen peroxide. Water stabilization will use calcium and alkalinity addition.
3. Purified water conveyance facilities – These would consist of new pipelines, an initial purified water pump station and a booster pump station, and appurtenant facilities to move the purified water from the AWT Facility to the Seaside Basin injection well facilities.
4. Injection well facilities – These would include new deep injection wells and vadose zone wells to inject the purified water into the Seaside Basin, backflushing facilities to percolate water pumped for well maintenance back into the Seaside Basin, pipelines, electricity/power distribution facilities, and electrical/motor control buildings.
5. Distribution of groundwater from Seaside Basin – This would include new CalAm distribution system improvements needed to convey extracted groundwater and deliver it to CalAm customers.
6. The GWR Project also would include modifications to the existing Salinas Industrial Wastewater Treatment Facility to allow the use of the existing treatment ponds for storage of excess winter source water flows.

An understanding of the potential public health implications for the use of purified water as a groundwater replenishment source is a fundamental and essential component of the EIR. Thus, as part of the work being performed for the EIR, this technical study was undertaken to evaluate (1) the status of recycled water regulations pertaining to groundwater replenishment; (2) studies of other similar projects that have assessed the effects of using recycled water for groundwater replenishment on groundwater quality and public health; (3) studies that have been specifically conducted for the GWR Project related to the AWT Facility design and performance; (4) studies that have been specifically conducted for the GWR Project regarding protection of groundwater quality and quantity; (5) GWR Project compliance with applicable statutes, policies, and regulations; (6) GWR Project effects on groundwater; and (7) the significance of this information for the EIR.

The remainder of this report is organized into the following sections:

- Section 3 - Overview of Statutory Requirements for Groundwater Replenishment
- Section 4 – Environmental Impact Report Groundwater Significance Criteria

- Section 5 - California Recycled Water Regulations for Groundwater Replenishment
- Section 6 - Overview of Drinking Water Standards and Advisory Levels
- Section 7 - State Water Resources Control Board Policies
- Section 8 - Central Coast Regional Water Quality Control Board Requirements
- Section 9 - Permitting Groundwater Replenishment Projects
- Section 10 - Studies and Tools to Assess the Safety of the Use of Recycled Water for Groundwater Replenishment
- Section 11 - Role and Activities of the Independent Advisory Panel
- Section 12 - Proposed Groundwater Replenishment Project Treatment Design
- Section 13 - Summary of the Groundwater Replenishment Project Water Quality and Compliance with Groundwater Replenishment Regulations and Central Coast Basin Plan
- Section 14 - Summary of Hydrogeologic and Geochemical Modeling
- Section 15 - Environmental Impact Report Groundwater Resources Significance Determination
- Section 16 - Constituents of Emerging Concern – Source Waters and Pilot Testing Results
- Seciton 17 - Summary of the Groundwater Replenishment Project Compliance with Regulations and Policies
- Section 18 - References
- Section 19 - Acronyms
- Section 20 - Glossary
- Appendix A – June 5, 2014 Letter from the Division of Drinking Water Regarding the Pure Water Monterey Groundwater Replenishment Project Concept
- Appendix B – All Analytes Included in the Source Water Sampling Program that were Detected in at Least One Sample of Any of the Untreated Source Waters
- Appendix C – Projected Monthly Flows of Source Waters to the Regional Treatment Plant Influent

## 3. Overview of Statutory Requirements for Groundwater Replenishment

The use of recycled water for planned groundwater replenishment projects in California is regulated under the Federal Safe Drinking Water Act, and several State laws, regulations, and policies, with different responsibilities assigned to the State Water Resources Control Board (SWRCB), the nine RWQCBs, and the SWRCB Division of Drinking Water (DDW) formerly the California Department of Public Health (CDPH).[6,7] Applicable federal statutes related to drinking water standards and regulations related to injection wells are addressed in later sections of this report.

The CWC and Health and Safety Code (H&SC) contain California's statutes that regulate the use of water, recycled water, and the protection of water quality, which are applicable to all groundwater replenishment projects that use recycled water. Some of the key statutes that ensure protection of water quality and public health are presented in **Table 1**.

**Table 1. Key California Statutes for Protection of Water Quality and Public Health**

| Code | Purpose |
|---|---|
| *Recycled Water Definitions* | |
| CWC Sections 13050, 13512, 13576, 13577, 13350, and 13552-13554[8] | Recycled water is defined in the CWC as water, which as a result of treatment of waste, is suitable for a direct beneficial use or a controlled use that would not otherwise occur and therefore considered a valuable resource. |
| CWC Sections 13561 | Defines direct potable reuse and indirect potable reuse for groundwater replenishment. |
| *Water Quality* | |
| CWC Section 13170 | Authorizes the SWRCB to adopt State policies for water quality control. |
| CWC Sections 13240-42 | Authorizes the RWQCB to adopt Water Quality Control Plans (Basin Plans) that assign beneficial uses for surface waters and groundwaters, and contain numeric and narrative water quality objectives that provide reasonable protection of the beneficial uses of the groundwater. One of the factors that must be considered when establishing water quality objectives is the need to develop and use recycled water. Basin Plans must include an implementation program for achieving the water quality objectives. |
| H&SC Sections 116270 et seq. | This is the California Safe Drinking Water Act that establishes primary and secondary maximum contaminant levels (MCLs) as included in the California Code of Regulations, Title 17 – Public Health, Chapter 5, Subchapter 1, Group 4 – Drinking Water Supplies, Sections 7583 through 7630.[9] |
| H&SC Section 116455 | Requires public water systems to take certain actions if drinking water exceeds Notification Levels (NLs). NLs are health-based advisory levels established by the DDW for chemicals in drinking water that lack MCLs. When chemicals are found at concentrations greater than their NLs, certain requirements and recommendations apply.[10] |
| *Recycled Water Permits* | |
| CWC Sections 13260, 13263, 13269, 13523.1 | Dischargers proposing to discharge waste that could affect the quality of waters of the state must file a report of waste discharge (ROWD) to the RWQCB. After receiving this report, the RWQCB can issue specific or general Waste Discharge Requirements (WDRs) and/or Water Recycling Requirements (WRRs) that reasonably protect all beneficial uses and that implement any relevant water quality |

[6] Note disposal of concentrate resulting from advanced treatment of recycled water that is mixed with secondary effluent for ocean discharge is regulated under the Clean Water Act and state laws, regulations, and policies. This aspect of the GWR Project is assessed in a separate Technical Memo and concludes that the GWR Project would comply with California Ocean Plan objectives (Trussell Technologies, 2015).

[7] Effective July 1, 2014, the CDPH Drinking Water Program (including recycled water responsibilities) was transferred to the SWRCB, and named the Division of Drinking Water.

[8] The Porter-Cologne Water Quality Control Act is contained in CWC Division 7 Water Quality, Sections 13000 et seq.

[9] See http://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/documents/lawbook/dwregulations-2014-07-01.pdf

[10] See http://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/NotificationLevels.shtml

| Code | Purpose |
|---|---|
| | control plans and policies. The RWQCB can also issue a Master Reclamation Permit, which is a WDR that covers multiple non-potable reuse applications and requires periodic site inspections and adoption of rules and regulations for recycled water use. A RWQCB may require a discharger to provide monitoring program reports or conduct studies. |
| CWC Section 13552.5 | Authorizes the SWRCB to adopt General Waste Discharge Requirements for Landscape Irrigation Uses of Municipal Recycled Water to streamline tertiary disinfected recycled water use. The General Permit was adopted in 2009; in 2014 the SWRCB adopted a new General Permit that supersedes this permit and covers all non-potable reuse applications.[11] |
| H&SC Section 116271 | Effective July 1, 2014 transfers the DDW Drinking Water Program to the SWRCB, including water reclamation and direct and indirect potable reuse; creates the Deputy Director of the new SWRCB DDW. |
| CWC Section 13528.5 | Effective July 1, 2014, the SWRCB may carry out the duties and authority granted to a RWQCB pursuant to Chapter 7 of the CWC (Water Reclamation Sections 13500 – 13557, which include issuing potable reuse permits). |
| *Recycled Water Regulations* | |
| CWC Sections 13500-13529.4; H&SC 116800 et seq. | Requires DDW to establish uniform statewide recycling criteria. DDW has developed these criteria for non-potable reuse and groundwater replenishment, and they are codified in Title 22 of the CCR. Regulations for cross connections are codified in Title 17. |
| CWC Section 13540 | Prohibits the use of any waste well that extends into a water-bearing stratum that is, or could be, used as a water supply for domestic purposes; injection wells or vadose zone wells used for replenishment are part of this category (injection wells or vadose zone wells are considered waste wells under the CWC). An exception can be provided if (1) the RWQCB finds that water quality considerations do not preclude controlled replenishment by direct injection, and (2) DDW finds, following a public hearing, that the proposed replenishment will not degrade groundwater quality as a source of domestic water supply. This Section of the CWC also allows DDW to make and enforce regulations pertaining to replenishment of recycled water using injection wells. |
| CWC Sections 13522.5 and 13523 | Requires any person who proposes to recycle or to use recycled water to file an Engineering Report with the RWQCB on the proposed use. After receiving the report, and consulting with and receiving recommendations from DDW, and any necessary evidentiary hearing, the RWQCB must issue a permit (WDRs and/or WRRs) for the use. |
| CWC Sections 13562-13563 | Requires DDW to adopt uniform water recycling criteria for groundwater replenishment by June 30, 2014 as emergency regulations, and for surface water augmentation by December 31, 2016 and requires DDW to investigate the feasibility of developing criteria for direct potable reuse and to provide a final report on that investigation to the Legislature by December 31, 2016. By February 14, 2015, DDW must convene an expert panel to advise DDW on water recycling criteria for surface water augmentation and the feasibility of direct potable reuse. |

## 4. Environmental Impact Report Groundwater Significance Criteria

CEQA is a California statute that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. The CEQA Guidelines are the regulations that explain and interpret the law for both the public agencies required to administer CEQA and for the public generally. The Guidelines are found in the California Code of Regulations, in Chapter 3 of Title 14.

Appendix G of the CEQA Guidelines provides the following two questions regarding groundwater resources:

- Would the project substantially deplete groundwater supplies or interfere substantially with groundwater replenishment such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop

[11] See http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2014/wqo2014_0090_dwq_revised.pdf

to a level which would not support existing land uses or planned uses for which permits have been granted)?

- Would the project violate any water quality standards or otherwise degrade water quality?

The following factors are relevant to addressing the above-listed questions from the CEQA Guidelines Appendix G:

- Whether the GWR Project, taking into consideration the proposed treatment processes and groundwater attenuation and dilution, would:
  (1) Impact groundwater quality so that it no longer met standards (e.g., Basin Plan beneficial uses and water quality objectives, including drinking water MCLs established to protect public health).
  (2) Degrade groundwater quality subject to statutory requirements, and to the SWRCB Anti-degradation Policy[12] and Recycled Water Policy.
- Whether operation of the GWR Project would result in groundwater mounding, change groundwater gradients, or lower groundwater levels such that nearby municipal or private groundwater production wells experience a reduction in well yield or physical damage (due to exposure of well screens) resulting in a well not being capable of supporting existing land uses or planned uses for which permits have been granted.
- Whether the GWR Project would result in changes to groundwater levels such that it would exacerbate seawater intrusion.

This report focuses on the effects of the proposed GWR Project on water quality, groundwater levels, and groundwater quantity, including compliance with standards and the potential to degrade groundwater quality.

## 5. Recycled Water Regulations for Groundwater Replenishment

### 5.1. Regulations in Title 22 Prior to June 2014

Prior to June 18, 2014, the Water Recycling Criteria (Title 22 of the California Code of Regulations) included narrative requirements (e.g., general descriptions of requirements rather than numeric limits or specified treatment schemes) for planned groundwater replenishment projects. The regulations required that recycled water must be at all times of a quality that fully protected public health with DDW recommendations made on an individual case basis taking into consideration all relevant aspects of each project, including the following factors: treatment provided; effluent quality and quantity; spreading area operations; soil characteristics; hydrogeology; residence time; and distance to withdrawal. Since 1976, DDW issued numerous draft versions of progressively more detailed groundwater replenishment regulations that served as guidance for the six existing groundwater replenishment projects, all of which are located in Southern California (see **Table 2**), as well as for planning groundwater replenishment projects.[13]

---

[12] Also included in the RWQCB Water Quality Control Plan.

[13] On additional project also has been permitted. In November 2014, the Central Coast RWQCB adopted a permit for the Cambria Emergency Water Supply Project. Unlike planned groundwater replenishment projects using recycled water, this project treats well water through an AWT Facility for injection into groundwater near potable supply wells. The well water being treated is comprised mostly of brackish groundwater, but depending on groundwater pumping it will also include secondary effluent from nearby secondary effluent disposal ponds. The project is necessary because of drought conditions and lack of natural replenishment water for the local groundwater basin. It is intended to only operate on a limited basis. The AWT Facility consists of MF, RO, UV/peroxide AOP, and free chlorine treatment. It was conditionally approved by DDW based on the June 2014 Groundwater Replenishment Regulations.

**Table 2. Permitted Groundwater Replenishment Projects in California**

| Project | Type of Groundwater Replenishment Application | Years of Operation | Recycled Water Treatment | Dilution Water | Recycled Water Volume AFY | Planned Recycled Water Expansion AFY |
|---|---|---|---|---|---|---|
| Montebello Forebay Project, Los Angeles County | Surface spreading | 52 | Disinfected tertiary | Storm water, potable water, groundwater underflow | 55,000[a] | 21,000[a] |
| West Coast Basin Seawater Intrusion Barrier, Los Angeles County | Injection | 20 | AWT | Potable water; will use 100% recycled water for future expansion | 17,000[a] | 7,200[a,b] |
| Dominquez Gap Seawater Intrusion Barrier, Los Angeles County | Injection | 11 | AWT | Potable water; will use 100% recycled water for future expansion | 5,400[a] | 7,500[a,c] |
| Chino Basin Project, San Bernardino County | Surface spreading | 9 | Disinfected tertiary | Storm water, potable water, groundwater underflow | 22,000[d] | --- |
| Alamitos Gap Seawater Intrusion Barrier Project, Los Angeles County | Injection | 9 | AWT | Potable water; will use 100% recycled water for future expansion | 3,400[a] | 8,900[a,b] |
| Groundwater Replenishment System (GWRS), Orange County | Injection (seawater barrier) and spreading | 5[e] | AWT | Use 100% AWT recycled water | 78,000[f] | 25,000[f] |

a. Source: information used for the Central and West Basin Salt Nutrient Management Plan (Nellor et al., 2012). The permit was amended in April 2014 to allow up to 45% recycled water to be used for replenishment.

b. Expected to be online in 2015. The permit was amended in June 2014 to allow up to 100% recycled water to be used for replenishment.

c. Expected to be online in 2017/18.

d. Source: from RWQCB Order No. R8-2005-0033.

e. Prior to GWRS, the Orange County Water District operated Water Factory 21 that blended AWT recycled water and local groundwater for injection to serve as a seawater intrusion barrier.

## 5.2. June 2014 Groundwater Replenishment Regulations

Final Groundwater Replenishment with Recycled Water Regulations hereafter, referred to as "Groundwater Replenishment Regulations," went into effect June 18, 2014 (SWRCB, 2014).

The overarching principles taken into consideration by DDW in developing the Groundwater Replenishment Regulations were:

- Groundwater replenishment projects are replenishing groundwater basins that are used as sources of drinking water.

- Control of pathogenic microorganisms should be based on a low tolerable risk that was defined as an annual risk of infection[14] from pathogen microorganisms in drinking water of one in 10,000 ($10^{-4}$). This risk level is the same as that used for the federal Surface Water Treatment Rule for drinking water.
- Compliance with drinking water standards for regulated chemicals.
- Controls for unregulated chemicals.
- No degradation of an existing groundwater basin used as a drinking water source.
- Use of multiple barriers to protect water quality and human health.
- Projects should be designed to identify and respond to a treatment failure. A component of this design acknowledges that groundwater replenishment projects inherently will include storage in a groundwater aquifer and include some natural treatment.

The key provisions of the Groundwater Replenishment Regulations that apply to subsurface application (e.g., the use of injection or vadose zone wells) that use 100% recycled water for application are summarized in **Table 3**.

**Table 3. Summary of June 2014 Groundwater Replenishment Regulations**

| Control Mechanism | Requirements |
|---|---|
| Source Control | Entities that supply recycled water to a groundwater replenishment project must administer a comprehensive source control program to prevent undesirable chemicals from entering wastewater. The source control program must include: (1) an assessment of the fate of DDW and RWQCB-specified contaminants through the wastewater and recycled water treatment systems; (2) provisions for contaminant source investigations and contaminant monitoring that focus on DDW and RWQCB-specified contaminants; (3) an outreach program to industrial, commercial, and residential communities; and (4) an up-to-date inventory of contaminants. |
| Pathogen Control | To meet the low tolerable risk level (a basic principle of the regulations), pathogen reduction requirements have been established for treatment of recycled water similar to the approach used for drinking regulations. The Groundwater Replenishment Regulations require a project to achieve a 12-log enteric virus reduction, a 10-log *Giardia* cyst reduction, and a 10-log *Cryptosporidium* oocyst reduction using at least 3 treatment barriers. To ensure that a barrier is significant, each barrier must achieve at least 1.0-log reduction. No treatment process can be credited with more than 6-log reduction. The log reductions must be verified using a procedure approved by DDW. Log reduction refers to the reduction of pathogenic microorganism concentrations on a log-scale (e.g., 3 logs is 99.9% removal). Failure to meet the specified reductions requires notification to DDW and RWQB, investigation, and/or discontinuation of recycled water use until a problem is corrected. Trussell et al. (2013) conducted an extensive review of the proposed pathogen reduction requirements in the Groundwater Replenishment Regulations and concluded that the assumptions used to derive the log reductions were conservative and provide a large factor of safety that likely reduces the actual risk of infection below the $10^{-4}$ level, particularly for control of the amount of a particular disease present in a community. |
| Nitrogen Control | To ensure protection of groundwater, the concentration of total nitrogen in recycled water must meet 10 milligrams per liter (mg/L) before or after recharge. Failure to meet this value requires follow-up sampling, notification to DDW and RWQCB, and/or discontinuation of recycled water use until a problem is corrected. |
| Regulated Chemicals Control | The recycled water must meet drinking water MCLs as specified by the Groundwater Replenishment Regulations. Failure to meet MCLs requires follow-up sampling, notification to DDW and RWQCB, and/or discontinuation of recycled water use until the problem is corrected. |

[14] There is a difference between infection and disease. Infection, often the first step, occurs when a pathogen enters a body and begins to multiply. Disease occurs when the cells in the body are damaged as a result of the infection and signs and symptoms of an illness appear. Infection necessarily precedes disease, but infection typically only leads to disease in a fraction of cases. Many factors influence the infection-to-disease ratio.

| Control Mechanism | Requirements |
|---|---|
| Unregulated Chemicals Control | Monitoring the concentrations and toxicities of thousands of potential organic compounds in any water supply would be an infeasible task. Control of unregulated chemicals for all groundwater replenishment projects using 100% AWT recycled water is accomplished through limits for Total Organic Carbon (TOC) and performance of treatment for constituents of emerging concern (CECs)[15]. TOC is used as a surrogate for unregulated and unknown organic chemicals. For subsurface application projects (injection and vadose wells), the entire recycled water flow must be treated using RO and AOP. After treatment, the TOC in the recycled water cannot exceed an average of 0.5 mg/L. Specific performance criteria for RO and AOP processes have been included in the Groundwater Replenishment Regulations. Failure to meet the requirements established for a groundwater replenishment project results in notifications to DDW and RWQCB, response actions, and in some cases cessation of the use of recycled water. |
| Response Retention Time (RRT) | The intent of the RRT is to provide time to retain recycled water underground to identify any treatment failure so that inadequately treated recycled water does not enter a potable water system. Sufficient time must elapse to allow for: a response that will protect the public from exposure to inadequately treated water; and provide an alternative source of water or remedial treatment at the wellhead if necessary. The RRT is the aggregate period of time between treatment verification samples or measurements; time to make the measurement or analyze the sample; time to evaluate the results; time to make a decision regarding the appropriate response; time to activate the response; and time for the response to work. The minimum RRT is 2 months, but must be justified by the groundwater replenishment project sponsor. |
| Monitoring Program | Comprehensive monitoring programs are established for recycled water and groundwater for regulated and unregulated constituents. |
| Operation and Optimization Plan | The intent of the plan is to assure that the facilities are operated to achieve compliance with the Groundwater Replenishment Regulations, to achieve optimal reduction of contaminants, and to identify how the project will be operated and monitored. |
| Boundaries Restricting Locations of Drinking Water Wells | Project sponsors must establish a "zone of controlled well construction," which represents the greatest of the horizontal and vertical distances reflecting the underground retention times required for pathogen control or for the RRT. Drinking water wells cannot be located in this zone. Project sponsors must also create a "secondary boundary" representing a zone of *potential* controlled well construction that may be beyond the zone of controlled well construction, thereby requiring additional study before a drinking water well is drilled. |
| Adequate Managerial and Technical Capability | A project sponsor must demonstrate that it possess adequate managerial and technical capability to comply with the regulations. |
| Engineering Report | The project sponsor must submit an Engineering Report to DDW and RWQCB that indicates how a groundwater replenishment project will comply with all regulations and includes a contingency plan to insure that no untreated or inadequately treated water will be used. The report must be approved by DDW. |
| Reporting | Annual reports must be submitted to DDW, RWQCB, and groundwater providers downgradient of injection wells; the Engineering Report must be updated every 5 years. |
| Alternatives | Alternatives to any of the provisions are allowed if: the project sponsor demonstrates that the alternative provides the same level of public health protection; the alternative has been approved by DDW; and an expert panel has reviewed the alternative unless otherwise specified by DDW. |
| Public Hearing | The project sponsor must hold a public hearing for a groundwater replenishment project after DDW approves the Engineering Report; based on the Engineering Report, the hearing, and public comments, DDW issues a conditional approval letter to the RWQCB for inclusion in the WDRs and/or WRRs issued by the RWQCB. Thus, including the hearing for the RWQCB permit, there are two public hearings for a groundwater replenishment project. Should DDW obtain primacy for issuing groundwater replenishment permits, the RWQCB would provide recommendations and conditions for inclusion in the WDRs and/or WRRs and the SWRCB would hold the permit hearing. |

[15] CECs include pharmaceuticals, ingredients in personal care products, and endocrine disrupting chemicals.

## 6. Overview of Drinking Water Standards and Advisory Levels

The Federal Safe Drinking Water Act allows the U.S. Environmental Protection Agency (USEPA) to promulgate national primary drinking water standards specifying MCLs for each contaminant present in a public water system with an adverse effect on human health, taking into consideration cost and technical feasibility. Primary MCLs have been established for approximately 90 contaminants in drinking water.[16] In cases where the MCLs cannot be feasibly ascertained, the USEPA may elect to identify and establish a schedule of "treatment techniques" preventing adverse effects on human health to the extent feasible. DDW has established its own set of MCLs either based on the Federal MCLs or as part of its own regulatory process. For example, California has an MCL for perchlorate while there is no Federal MCL.[17]

Drinking water MCLs are established in two steps. For the Federal process, the USEPA establishes MCL goals (MCLGs) and, for the State purposes, DDW establishes Public Health Goals (PHGs), which are the maximum levels of a contaminant in drinking water at which no known or anticipated adverse effect on the health of persons would occur, and which allow an adequate margin of safety. The MCLGs have been historically set at zero for microbial and carcinogenic contaminants; chemical PHGs for carcinogens are set at the $10^{-6}$ risk level. Once the MCLG or PHG is established, the USEPA or DDW determines the feasible MCL or treatment technology level that may be achieved with the use of the best available technology and treatment techniques, and taking cost into consideration.

There are also a variety of chemicals of health concern whose occurrence is too infrequent in conventional drinking water sources to justify the establishment of national standards, but are addressed using advisory levels. The USEPA establishes health advisories to address many of these latter chemicals. The DDW has established its own health advisories for chemicals in drinking water without MCLs: NLs and Response Levels.[18] If a chemical concentration is greater than its NL in drinking water, the utility that distributes the water must inform its customers and consumers about the presence of the chemical, and about health concerns associated with exposure to it. If a chemical is present in drinking water that is provided to consumers at concentrations greater than the NL (10 to 100 times greater depending on the toxicological endpoint of the constituent), DDW recommends that the source be taken out of service (this concentration is called the Response Level). The Groundwater Replenishment Regulations include requirements for monitoring recycled water for NLs and actions to be taken if concentrations exceed NLs.

## 7. State Water Resources Control Board Policies

There are two policies of particular importance with respect to groundwater replenishment projects for protection of water quality and human health: (1) anti-degradation policies, and (2) the Recycled Water Policy.

### 7.1. Anti-degradation Policies

California's anti-degradation policies are found in Resolution 68-16, Policy with Respect to Maintaining Higher Quality Waters in California, and Resolution 88-63, Sources of Drinking Water Policy.[19] These resolutions are binding on all State agencies. They apply to both surface waters and groundwaters (and thus groundwater replenishment projects), protect both existing and potential beneficial uses of surface water and groundwater, and are incorporated into RWQCB Basin Plans.

***Resolution 68-16 (Anti-degradation Policy)***

The Anti-degradation Policy requires that existing high water quality be maintained to the maximum extent possible, but allows lowering of water quality if the change is "consistent with maximum benefit to the

[16] For a current list of MCLs, see http://www.epa.gov/safewater/contaminants/index.html.
[17] For a comparison see: http://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/Chemicalcontaminants.shtml
[18] See http://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/NotificationLevels.shtml
[19] See http://www.swrcb.ca.gov/plans_policies/.

people of the state, will not unreasonably effect present and anticipated use of such water (including drinking), and will not result in water quality less than prescribed in policies." The Anti-degradation Policy also stipulates that any discharge to existing high quality waters will be required to "meet waste discharge requirements which will result in the best practicable treatment or control of the discharge to ensure that (a) pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained."

***Resolution 88-63 (Sources of Drinking Water Policy)***

The Sources of Drinking Water Policy designates the municipal and domestic supply (MUN) beneficial use for all surface waters and groundwater except for those: (1) with total dissolved solids (TDS) exceeding 3,000 mg/L, (2) with contamination that cannot reasonably be treated for domestic use, (3) where there is insufficient water supply, (4) in systems designed for wastewater collection or conveying or holding agricultural drainage, or (5) regulated as a geothermal energy producing source. Resolution 88-63 addresses only designation of water as drinking water source; it does not establish objectives for constituents that threaten source waters designated as MUN.

## 7.2. Recycled Water Policy

The Recycled Water Policy was adopted by the SWRCB in February 2009. It was subsequently amended in 2013 with regard to CEC monitoring for groundwater replenishment projects. The Recycled Water Policy was a critical step in creating uniformity in how RWQCBs were individually interpreting and implementing Resolution 68-16 for water recycling projects, including groundwater replenishment projects. The critical provisions in the Policy related to groundwater replenishment projects are discussed in the following subsections.

***Salt/Nutrient Management Plans***

In recognition that some groundwater basins in the state contain salts and nutrients that exceed or threaten to exceed Basin Plan groundwater objectives, and that some Basin Plans do not have adequate implementation measures to achieve compliance, the Recycled Water Policy includes provisions for managing salts and nutrients on a regional or watershed basis through development of Salt/Nutrient Management Plans (SNMPs) rather than imposing requirements on individual recycled water projects (which had been the practice prior to adoption of the Recycled Water Policy). Unfavorable groundwater salt and nutrient conditions can be caused by natural soils, discharges of waste, irrigation using surface water, groundwater, or recycled water, and water supply augmentation using surface or recycled water. Regulation of recycled water alone will not address these conditions.

SNMPs are to be developed for every groundwater basin/sub-basin by May 2014 (May 2016 with a RWQCB-approved extension). The SNMP must identify salt and nutrient sources; identify basin/sub-basin assimilative capacity and loading estimates; and evaluate the fate and transport of salts and nutrients. The SNMP must include implementation measures to manage salt and nutrient loadings in the basin on a sustainable basis and an anti-degradation analysis demonstrating that all recycling projects identified in the plan will collectively satisfy the requirements of Resolution No. 68-16. The SNMP must also include an appropriate cost effective network of monitoring locations to determine if salts, nutrients and other constituents of concern (as identified in the SNMPs) are consistent with applicable water quality objectives.

***Regional Water Quality Control Board Groundwater Requirements***

The Recycled Water Policy does not limit the authority of a RWQCB to include more stringent requirements for groundwater replenishment projects to protect designated beneficial uses of groundwater, *provided* that any proposed limitations for the protection of public health may only be imposed following regular consultation with DDW. The Recycled Water Policy also does not limit the authority of a RWQCB to impose additional requirements for a proposed groundwater replenishment project that has a substantial adverse effect on the fate and transport of a contaminant plume (for example those caused by industrial contamination or gas stations), or changes the geochemistry of an aquifer thereby causing the dissolution of naturally occurring constituents, such as arsenic, from the geologic formation into groundwater. These provisions require additional assessment of the impacts of a groundwater replenishment project on areas of contamination in a basin and/or if the quality of the water used for replenishment causes constituents, such as naturally occurring arsenic, to become mobile and impact groundwater.

***Anti-degradation and Assimilative Capacity***

Assimilative capacity is the ability for groundwater to receive contaminants without detrimental effects to human health or other beneficial uses. It is typically derived by comparing background ambient chemical concentrations in groundwater to the concentrations of the applicable Basin Plan groundwater quality objectives. The difference between the ambient concentration and groundwater quality objective is the available assimilative capacity.

The Recycled Water Policy establishes two assimilative capacity thresholds in the absence of an adopted SNMP. A groundwater replenishment project that utilizes less than 10% of the available assimilative capacity in a groundwater basin/sub-basin (or multiple projects utilizing less than 20% of the available assimilative capacity in a groundwater basin/sub-basin) are only required to conduct an anti-degradation analysis verifying the use of the assimilative capacity. In the event a project or multiple projects utilize more than the designated fraction of the assimilative capacity (e.g., 10% for a single project or 20% for multiple projects), the project proponent must conduct a RWQCB-deemed acceptable (and more elaborate) anti-degradation analysis. A RWQCB has the discretionary authority to allocate assimilative capacity to groundwater replenishment projects. There is a presumed assumption that allocations greater than the Recycled Water Policy thresholds would not be granted without concomitant mitigation or an amendment to the Basin Plan groundwater quality objective to create more assimilative capacity for allocation. Groundwater replenishment projects that utilize AWT recycled water will use very little to essentially none of the available assimilative capacity because of the high quality of the water.

## 7.3. Constituents of Emerging Concern

***Background on CECs***

Among the perceived risks of using recycled water for groundwater replenishment is concern about the presence of trace concentrations of pharmaceuticals, ingredients in personal care products (such as insecticides and flame retardants), and chemicals that can affect the human endocrine system in terms of growth, reproduction, and sexual behavior (e.g., endocrine disrupting chemicals). These chemicals are often grouped together and are called CECs in the Recycled Water Policy. Low concentrations of CECs have been found in wastewater, recycled water, surface water, drinking water, and groundwater. The ability to detect these chemicals at very low levels has outpaced the ability to completely remove them (if needed) from the environment.

CECs are effectively removed by many recycled water treatment processes, including the oxidative processes and RO in AWT, but can sometimes be detected after treatment. For example, N,N-diethyl-metatoluamide (DEET), is the active ingredient in many insect repellent products, specifically used to repel mosquitoes and ticks. DEET has been measured in tertiary recycled water at a 90$^{th}$ percentile[20] concentration of 1.52 micrograms per liter (µg/L)[21] (Anderson et al., 2010) and is removed in AWT by more than 90% (Drewes et al., 2008). More information on CECs in the context of the pilot testing for the GWR Project is provided later in the report.

Simply detecting a compound, however, does not mean that its presence is of health significance. Because many CECs do not have established drinking water standards or advisory levels, researchers have developed a method to estimate concentrations that can be ingested daily over a lifetime without appreciable risk. This method utilizes information on chemical toxicity (often described on a per-body-weight basis), along with

[20] 90% of the samples tested are less than this value.
[21] A µg/L is one part per billion, or the equivalent of two drops of water in a typical 15,000-gallon backyard swimming pool.

assumptions about the population and their water consumption. The procedure to derive this estimated "safe" amount involves collecting all relevant toxicity data, ascertaining the completeness of the data, determining the most sensitive toxicity outcome (taking into account sensitive population groups such as infants, children, pregnant women, and those with compromised health), and applying appropriate safety factors. Health outcomes include therapeutic doses of medications, the no observed adverse effect level (NOAEL), the lowest observed no adverse effect level (LOAEL), and carcinogenicity. To account for the variability and uncertainty that are reflected in differences between test animals and humans and variability within the human population, the numerical health outcomes are lowered by applying uncertainty factors thereby adding a layer of conservatism. Depending on the researcher conducting the study, these estimated safe amounts are called different names: Tolerable Daily Intakes (TDIs), Acceptable Daily Intakes (ADIs), or Predicted No Effect Concentrations (PNEC) (Schwab et al., 2005, Environment Protection and Heritage Council et al., 2008, Environment Protection and Heritage Council et al, 2008, Anderson et al., 2010, Bruce et al., 2010a,b).

These research projects have selected CECs for evaluation, considering the approximately 3,000 most used chemicals that might be present in recycled or drinking water, including prescription drugs, drugs of abuse, over-the-counter drugs, veterinary pharmaceuticals, personal care products, components of household products, and chemicals that can disrupt the human endocrine system. The selection process considers:

- The likelihood of occurrence in recycled water on the basis of evidence of detection in wastewater treatment plant effluents, effluent-dominated surface waters, and/or drinking water; the rate of pharmaceutical use; or physical/chemical properties predictive of resistance to water treatment and the potential to migrate in groundwater.
- The likelihood to cause adverse health effects in humans at very low, chronic exposure levels, particularly given any evidence of carcinogenicity, impairment of fertility, or developmental toxicity in animal or human studies.
- Public, scientific, and regulatory interest.
- The ability of different chemical or drug groups to represent different mechanisms of action or use patterns.

In order to compare the estimated safe amounts to concentrations of chemicals in recycled water or drinking water, researchers calculate a Drinking Water Equivalent Level (DWEL). The DWEL represents the concentration of a chemical in drinking water that would be equivalent to the TDI/ADI/PNEC, assuming a 150-pound person (70 kilograms or kg) consumes 2 liters (L) of water per day (d) (or about 8½ cups) using the following equation:

$$\textbf{DWEL } (\mu g/L) = \frac{\textbf{TDI } (\mu g/kg/day) \times 70 \text{ kg}}{2 \text{ L/day}}$$

Anderson et al. (2010) presents a compendium of TDIs, ADIs, PNECs, and DWELs for over 400 CECs.

To put the DWELs into understandable terms to support risk communication, they can be compared to the highest (worst case) concentrations that have been detected in wastewater, recycled water, or drinking water sources. It is then possible to calculate the number of 8-ounce glasses of water containing the detected concentrations that a person would have to drink to reach the upper limit of acceptable levels (the DWEL).

$$\textbf{Required water consumption (L/day)} = \frac{\textbf{DWEL } (\mu g/L) \times 2L/day}{\textbf{Detected water concentration } (\mu g/L)}$$

Some examples of DWELs and water consumption rates to reach the DWEL are presented in **Table 4**.

**Table 4. Daily Water Consumption Equal to the Drinking Water Equivalent Level[a]**

| Compound | Type of Compound | DWEL µg/L | Consumption Rate Required to Equal DWEL (8-ounce Glasses/Day)[b] |
|---|---|---|---|
| Alprazolam | Anti-anxiety medication | 14 | 39 |
| Ciprofloxacin | Antibiotic | 17 | 4,800 |
| Clonidine | Blood pressure medication | 0.028 | >99 |
| DEET | Insecticide | 81 | 3,500 |
| Ibuprofen | Analgesic | 34 | 290 |
| Morphine | Analgesic | 1.0 | 42 |
| Primidone | Anticonvulsant | 0.85 | 55 |
| Salicylic acid | Skin care product ingredient | 54 | 420 |
| TCEP[c] | Flame retardant | 4.4 | 84 |
| Di-*n*-butyl phthalate | Plasticizer | 14 | 200 |

a. Source: Bruce et al., 2010a.

b. The water concentrations used to derive the consumption rates are to serve as an example only and are based on Bruce et al. (2010a), and do not reflect the data for the GWR Project. Bruce et al. (2010a) used the highest concentration of a CEC detected in water (surface and groundwater) and wastewater found in the literature, from studies in the U.S. and overseas, and thus was a very conservative approach.. As discussed later in this report, none of the example CECs were detected in the RO permeate from the pilot testing or would be found after treatment at the full-scale AWT Facility.

c. TCEP - Tris(2-chloroethyl)phosphate.

In general, for those CECs whose presence in recycled water, drinking water or other water sources has been evaluated, CECs were many times lower than the acceptable concentrations based on the DWELs.

***CEC Monitoring***

As part of the SWRCB Recycled Water Policy, a Science Advisory Panel was formed to identify a list of CECs for monitoring in recycled water used for groundwater replenishment. The Panel completed its report in June 2010 and recommended monitoring a specific list of selected health-based and treatment performance indicator CECs and surrogates (Anderson et al., 2010). The groundwater replenishment monitoring recommendations were directed at (1) surface spreading using tertiary recycled water, specifically monitoring recycled water and groundwater; and (2) injection projects using RO and AOP, specifically monitoring recycled water. The framework used to select CECs for monitoring compared Measured Environmental Concentrations (MECs) in recycled water to Monitoring Trigger Levels (MTLs). The MTLs are equivalent to DWELs discussed in the CEC background section of this report.

The Panel embedded a number of conservative assumptions within the framework used to identify CECs for monitoring in recycled water:

- The Panel elected to use available MEC data for secondary and tertiary recycled water. This approach results in MECs that are on the order of 40 to 800 times higher than what is likely observed in purified water that has also received AWT.
- No credit was given to the MECs for dilution through mixing with native groundwater, although this will naturally occur for both of the aquifers involved in the GWR Project.
- The 90$^{th}$ percentiles of MECs were used, which provides a safety factor of approximately 10-fold.
- The derivation of the MTLs include safety factors ranging from 100 to 10,000.

Overall, the assumptions used by the Panel to identify CECs for monitoring groundwater replenishment projects included between 6 to 11 orders of magnitude of conservatism. Some of the CECs were selected for monitoring based on their potential to pose a human health risk if present in drinking water, while others were selected to evaluate recycled water treatment performance, or both.

The SWRCB amended the Recycled Water Policy in 2013 to include the Panel's recommended CEC monitoring program, including the final list of specific CECs and monitoring frequencies for groundwater replenishment projects (see **Table 5**), and procedures to evaluate the data and for responding to the monitoring results (see **Table 6**). For health-based CECs, the responses in Table 6 are based on comparing measured concentrations in recycled water after treatment (RO or RO with AOP for subsurface application projects) to the MTLs. The monitoring and response requirements will be incorporated into groundwater replenishment project permits. As part of the Groundwater Replenishment Regulations, DDW has its own CEC requirements and monitoring locations that must be met (and established on a project-by-project basis) in addition to the Recycled Water Policy requirements. The next update of CEC monitoring by a SWRCB expert panel will occur in 2015.

**Table 5. Recycled Water Policy - Monitoring for Constituents of Emerging Concern for Groundwater Replenishment Projects**

| Constituent | Constituent Group | Relevance / Indicator Type | Method Reporting Limit (µg/L)[a,b] | MTL (µg/L) | Example of Treatment % Removal[c] |
|---|---|---|---|---|---|
| 17β-estradiol | Steroid hormones | Health | 0.001 | 0.0009 | ---[f] |
| Caffeine | Stimulant | Health & Performance | 0.05 | 0.35 | >90 |
| NDMA[d] | Disinfection byproduct | Health & Performance | 0.002 | 0.01 | 25-50, >80[e] |
| Triclosan | Antimicrobial | Health | 0.05 | 0.35 | ---[f] |
| DEET | Personal care product | Performance | 0.05 | ---[g] | >90 |
| Sucralose | Food additive | Performance | 0.1 | ---[g] | >90 |

a. The Method Reporting Level is the smallest measured concentration of a substance that can reliably be measured using a given analytical method.
b. Monitoring frequency is quarterly for the initial assessment phase; semi-annually for the baseline phase; and semi-annually to annually for the standard operation phase; CEC monitoring can be removed or increased based on the results.
c. These percentages are one example from one study that evaluated treatment performance; specific removal percentages are to be established for each groundwater replenishment project.
d. NDMA – N-nitrosodimethylamine.
e. For RO, the range is 25-50%; for RO with AOP, the removal is greater than 80%.
f. Not applicable.
g. The Panel used "N/A" in its report for the MTL because DEET is a performance indicator; DEET does have a DWEL of 2.5 µg/L (Environment Protection and Heritage Council et al., 2008).
h. The Panel used "N/A" in its report for the MTL but showed the MEC/MTL ratio equal to 0.02. Based on the sucralose MEC of 26,390,000 µg/L, a calculated MTL would be 527,800 µg/L. This value is higher than a calculated DWEL of 175,000 µg/L based on the Food and Drug Administration's ADI for sucralose, which is an artificial sweetener. Because sucralose is present in wastewater (and is not toxic), it serves as an excellent treatment performance indicator.

**Table 6. Recycled Water Policy - Thresholds and Response Actions for Health-based Indicators**

| MEC/MTL Threshold | Response Action |
|---|---|
| If greater than 75% of the MEC/MTL ratio results for a CEC are less than or equal to 0.1 during the baseline monitoring phase and/or subsequent monitoring | A) After completion of the baseline-monitoring phase, consider requesting removal of the CEC from the monitoring program. |
| If MEC/MTL ratio is greater than 0.1 and less than or equal to 1 | B) Continue to monitor. |
| If MEC/MTL ratio is greater than 1 and less than or equal to 10 | C) Check the data.<br>Continue to monitor. |
| If MEC/MLT ratio is greater than 10 and less than or equal to 100 | D) Resample immediately and analyze to confirm CEC result.<br>Continue to monitor. |
| If MEC/MLT ratio is greater than 100 | E) Resample immediately and analyze to confirm result.<br>Continue to monitor.<br>Contact the RWQCB and DDW to discuss additional actions.<br>(Additional actions may include, but are not limited to, additional monitoring, toxicological studies, engineering |

| MEC/MTL Threshold | Response Action |
|---|---|
| | removal studies, modification of facility operation, implementation of a source identification program, and monitoring at additional locations.) |

## 8. Central Coast Regional Water Quality Control Board Requirements

The Central Coast RWQCB is currently responsible for regulating recycled water discharges to groundwater, which are subject to state water quality regulations and statutes.

### 8.1. Groundwater Beneficial Uses and Water Quality Objectives

WDRs issued by the Central Coast RWQCB are required to implement applicable State water quality control policies and plans, including water quality objectives and implementation policies established in the Basin Plan.[22] The Basin Plan designates beneficial uses and groundwater quality objectives on a sub-basin basis. Groundwater throughout the Central Coast Basin (except for the Soda Lake Sub-basin) is suitable for agricultural water supply (AGR), MUN, and industrial use. The Basin Plan has:

- General narrative groundwater objectives that apply to all groundwaters for taste and odor and radioactivity.
- For MUN beneficial uses - groundwater criteria for bacteria and DDW primary and secondary MCLs.
- For AGR beneficial uses - objectives to protect soil productivity, irrigation, and livestock watering.

Permit limits for groundwater replenishment projects are set to ensure that groundwater does not contain concentrations of chemicals in amounts that adversely affect beneficial uses or degrade water quality. For some specific groundwater sub-basins, the Basin Plan establishes specific mineral water quality objectives for TDS, chloride, sulfate, boron, sodium, and nitrogen. No specific numeric objectives have been established in the Basin Plan for the Seaside Basin for these constituents other than those with MCLs.

## 9. Permitting Groundwater Replenishment Projects

### 9.1. Division of Drinking Water and Regional Water Quality Control Board Roles

The current (potentially interim) process for project approval and permitting of groundwater replenishment projects is depicted in **Figure 1**. The RWQCB issues the permit based on the Groundwater Replenishment Regulation, any specific DDW conditions, and requirements consistent with Basin Plans, SNMPs, and State policies. Effective July 1, 2014, the DDW as part of the SWRCB has the authority to issue WDRs and WRRs. As the DDW transition proceeds during fiscal year 2014/15, more information will be available on how permitting responsibilities will be handled by DDW and RWQCBs.

[22] See http://www.waterboards.ca.gov/rwqcb3/publications_forms/publications/basin_plan/.

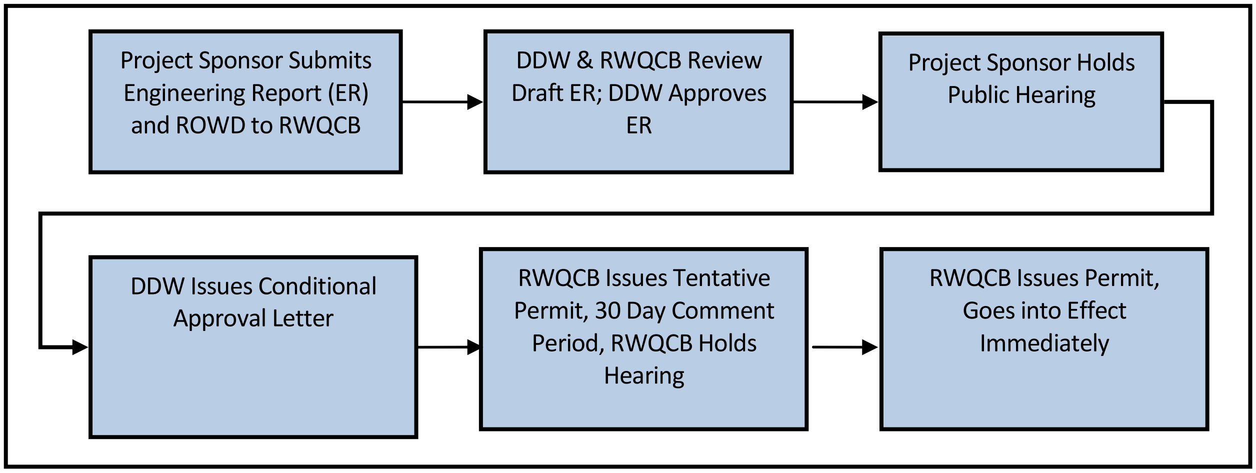

**Figure 1. Current Regulatory Process for Groundwater Replenishment Projects Using Recycled Water**

If DDW becomes the permitting authority for groundwater replenishment projects, the possible approval and permitting process may follow the steps shown in **Figure 2.**

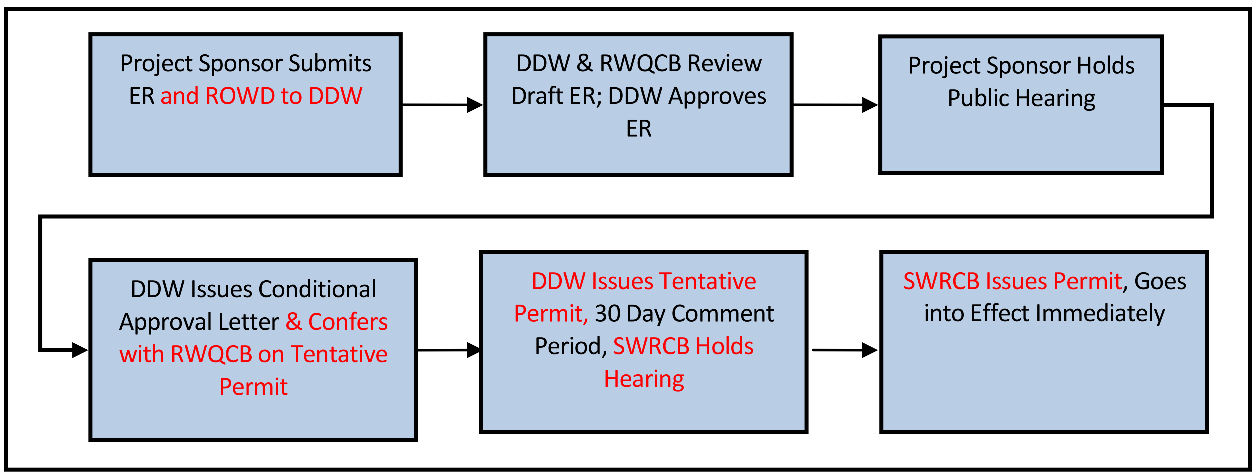

**Figure 2. Potential Regulatory Process for Groundwater Replenishment Projects Using Recycled Water**

In some cases, as a step before proceeding with an Engineering Report, a project sponsor will seek conditional approval from DDW of a conceptual project proposal. This approach was taken for the GWR Project. In May 2014, MRWPCA submitted a proposal, which was reviewed by the IAP, for review by DDW (MRWPCA, 2014). On June 5, 2014, DDW submitted a letter to MRWPCA (see Appendix A) that conditionally approved the GWR Project proposal. DDW also listed the following future submittal requirements:

- The Engineering Report, final design and Contingency Plan.
- The Operations Plan.
- The Response Plan.
- The Water Quality Monitoring Plan.
- Monitoring well program justification.
- Information on MRWPCA's technical and managerial capacity with a focus on treatment plant operators.

### 9.2. Federal Requirements for Groundwater Replenishment Projects (Underground Injection Control)

At this time there are no Federal permitting requirements for surface application groundwater replenishment projects; the USEPA's underground injection control (UIC) program does apply to injection wells, but has no permitting consequences for the GWR Project. The UIC program has categorized injection wells into five classes, only one of which (Class V) applies to groundwater replenishment projects. Under the existing Federal regulations, Class V injection wells are "authorized by rule" which means they do not require a Federal permit if they do not endanger underground sources of drinking water and comply with other UIC program requirements. For California, USEPA Region 9 is the permitting administrator for Class V wells. Any injection project planned in California must meet the State Sources of Drinking Water Policy, which ensures protection of groundwater quality for drinking water supplies, and therefore a Federal permit would not be necessary.[23] All Class V injection well owners in California are required to submit information to USEPA Region 9 on the well for USEPA's inventory.[24]

## 10. Studies and Tools to Assess the Safety of the Use of Recycled Water for Groundwater Replenishment

This Section presents information on studies and tools designed to evaluate the effects of recycled water used for groundwater replenishment on human health. These types of studies and tools show that the use of recycled water for such use is a safe sustainable practice.

- Epidemiological studies.
- Risk assessments.
- Bio-analytical screening tools.

### 10.1. Epidemiology Studies

Epidemiological studies evaluate the relation between an environmental pollutant and human health using data to characterize exposures to the pollutant, including concentrations in the environment, the probability and characteristics of human exposure, and the distributions of internal doses, as well as trends or differences in the health status of exposed people. Over the past 30 years, a limited number of epidemiology studies have specifically been conducted to evaluate the public health implications of using recycled water for groundwater replenishment and for direct potable reuse.[25]

The epidemiology studies rely on exposure and outcome data for groups rather than individuals. The diseased persons in the study may not be the most exposed individuals, but this cannot be determined. Nor is information on important risk factors (such as smoking, alcohol consumption, and occupational/environmental exposure that might affect disease incidence) typically available or controllable in the analysis. Other confounding factors can include population migration in and out of the study areas and the use of bottled water. Although epidemiology is helpful as part of an evaluative suite of analytical tools used to assess risk, epidemiology may be most useful at bounding the extent of risk, rather than actually determining the presence of risk at any level (NRC, 2012).

A summary of the relevant projects and related studies is presented in **Table 7**. The Montebello Forebay Project, which uses tertiary recycled water for groundwater replenishment, has been the subject of three epidemiology studies that have shown that there was no association between use of tertiary recycled water and mortality or morbidity.

---

[23] See http://water.epa.gov/type/groundwater/uic/class5/frequentquestions.cfm#do_i.

[24] http://www.epa.gov/region9/water/groundwater/uic-classv.html, and http://www.epa.gov/region9/water/groundwater/injection-wells-register.html.

[25] California law defines direct potable reuse as the planned introduction of recycled water either directly into a public water system or into a raw water supply immediately upstream of a water treatment plant.

**Table 7. Summary of Potable Reuse Epidemiology Studies**

| Project | Description | Studies/Results |
|---|---|---|
| **Groundwater Replenishment** | | |
| Montebello Forebay Groundwater Recharge Study, Los Angeles County, California (Nellor, et al., 1984; Sloss et al., 1996; Sloss et al. 1999) | Recycled water has been used as a source of replenishment since 1962; other replenishment sources are imported river water (Colorado River and State Project water) and local storm runoff. Water is percolated into the groundwater using two sets of spreading grounds. From 1962 to 1977, the water used for replenishment was disinfected secondary effluent. Granular media filtration was added later to enhance virus inactivation during final disinfection. During this time period, the amount of recycled water spread annually averaged 27,000 acre-feet (AF), which was 16% of the inflow to the groundwater basin. At that time an arbitrary cap of 32,700 AFY of recycled water had been established. In 1987, the project was allowed in increase the amount of recycled water to 50,000 AFY. The current permit allows for a maximum recycled water contribution of 35% based on a 10-year average. The recycled water meets drinking water standards for chemical constituents and also meets California recycling criteria for total coliforms < 2.2/100 milliliters (mL), and turbidity < 2 Nephelometric Turbidity Units (NTU). | The studies have looked at health outcomes for 900,000 people that received some recycled water in their household water supplies in comparison to 700,000 people in a control population. Three sets of studies have been conducted: 1) the Health Effects Study, which evaluated mortality, morbidity, cancer incidence, and birth outcomes for the period 1962-1980; 2) the Rand Study (Sloss et al., 1996), which evaluated mortality, morbidity, and cancer incidence for the period 1987-1991; and 3) the second Rand Study (Sloss et al. 1999), which evaluated adverse birth outcomes for the period 1982-1993.<br><br>Health Effects Study (1962-1980): the epidemiological studies focused on a broad spectrum of health concerns that could potentially be attributed to constituents in drinking water. Health parameters evaluated included: mortality (death from all causes, heart disease, stroke, all cancers and cancers of the colon, stomach, bladder and rectum); cancer incidence (all cancers, and cancers of the colon, stomach, bladder, and rectum); infant and neonatal mortality; low birth weight; congenital malformations; and selected infectious diseases (including *Hepatitis A* and *Shigella*). Another part of the study consisted of a telephone interview of adult females living in recycled water and control areas. Information was collected on spontaneous abortions and other adverse reproductive outcomes, bed-days, disability-days, and perception of well being. The survey was able to control for the confounding factors of bottled water usage and mobility.<br><br>Rand (1987–1991): the study evaluated cancer incidence (all cancers, and cancer of the bladder, colon, esophagus, kidney, liver, pancreas, rectum, stomach); mortality (death from all causes, cancer, cancer of the bladder, colon, esophagus, kidney, liver, pancreas, rectum, stomach, heart disease, cerebrovascular disease); and infectious diseases (including *Giardia*, *Hepatitis A*, *Salmonella*, *Shigella*).<br><br>Rand (1982–1993): the evaluation focused on two types of adverse birth outcomes: (a) prenatal development and infant mortality (including: low birth weight (full term only), low birth weight (all births), very low birth weight, preterm birth, infant mortality); and (b) birth defects (all defects, neural tube defects, other nervous system defects, ears, eyes, face, neck defects; major cardiac defects, patent ductus arteriosus, other cardiac defects, and respiratory system defects; cleft defects, pyloric stenosis, intestinal artesias, other digestive system defects; limb, other musculoskeletal, integument and all other defects; chromosomal syndromes and syndromes other than chromosomal).<br><br>These three studies found that after almost 30 years of groundwater replenishment, there was no association between tertiary recycled water consumption and higher rates of cancer, mortality, infectious disease, or adverse birth outcomes. |
| **Direct Potable Reuse** | | |
| Windhoek, Namibia (Isaacson and Sayed, 1988) | This is an ongoing direct reuse project that began in 1968. At the time the study was conducted, | The study, which was conducted for the period 1976–1983, looked at cases of diarrheal diseases. For the Caucasian population of similar socio-economic status studied, disease |

| Project | Description | Studies/Results |
|---|---|---|
| | the recycled water was treated using sand filtration and granular activated carbon (GAC), and the recycled water was added to the drinking water supply system. The treatment system for this project has been upgraded since this work was conducted. The highly treated recycled water is blended with treated dam water and/or groundwater. The maximum portion of recycled water fed into the potable water distribution system is 50% in times of low water demand (winter season) (Lahnsteiner and Lempert, 2007). The drinking water system serves 250,000 people. Water quality guarantee values have been established for the project based on the World Health Organization Guidelines, the Rand Water Guidelines (South Africa), and the Namibian Guidelines for Group A Water. | incidence was marginally lower in persons supplied with recycled water than those with water from conventional sources. Incidence rates were significantly higher in black populations, all of whom received conventional water only. Age-specific incidence rates in children of the various ethnic groups also showed differences characteristically associated with socio-economic stratification. The study concluded that the consumption of recycled water did not increase the risk of diarrheal diseases caused by waterborne infectious agents. |
| Chanute, Kansas (Metzler et al., 1958) | This project provided emergency use of recycled water during a drought for 150 days during 1956-57. The Neosho River was dammed below the outfall of the sewage treatment plant and the treated effluent backed up to the water intake. The impounding acted as waste stabilization and water was chlorinated prior to service. The use ended when heavy rains washed out the temporary dam. The river water source already contained wastewater prior to this event. | An epidemiology study showed fewer cases of stomach and intestinal illness during the period when recycled water was used than the following winter when Chanute returned to using river water. |

## 10.2. Risk Assessment

Risk assessment can be defined as the determination of a quantitative or qualitative value of risk related to a specific situation and a recognized threat (or hazard). Typically, the goal of an environmental risk assessment is to estimate the severity and likelihood of harm to human health or the environment occurring from exposure to a (chemical or microbiological) risk agent (Cohrssen and Covello, 1989). Information obtained from risk assessments can be used to make risk management and policy decisions.

In 1983, in response to a request by the U.S. Congress, the National Academy of Sciences National Research Council (NRC), developed a risk assessment framework that primarily addressed human health effects associated with exposure to chemical contaminants in the environment and how risk assessment should be addressed as part of the development of regulations (NRC, 1983). The framework has also served as a template for the development of numerous subsequent risk assessments and risk assessment frameworks. Those steps in that framework include:

- Hazard identification: Evaluate data and identify detected chemicals that can be used to represent the potential carcinogenic risk and noncarcinogenic hazard posed by the test waters.

- Dose response assessment: Evaluate the potential carcinogenicity and noncarcinogenic effects of the chemicals of concern.
- Exposure assessment: Estimate the potential doses based on observed concentrations and assumed intake levels or rates.
- Risk characterization: Compute the potential health risks associated with the test waters.

Risk assessment following a modified form of this framework can also be conducted for microorganisms.

The 1983 risk assessment framework was enhanced in 2009 by expanding on problem formulation and risk-based decision-making, and by including provisions for internal and external stakeholder involvement in all stages of risk assessment (NRC, 2009).

The USEPA Office of Drinking Water uses a "regulatory window" of $10^{-6}$ to $10^{-4}$ for evaluation of risk where $10^{-4}$ is the baseline risk for all regulations and $10^{-6}$ is the *de minimis* risk level, where *de minimis* risk levels infer that the activity is essentially "risk free." Acceptable risk differs from *de minimis* risk in that it incorporates factors beyond health-based criteria alone, such as the technological feasibility or economic impacts of achieving a given level of risk. Under ideal conditions, the acceptable risk would meet the *de minimis* criteria while being technically and economically practical. However, a compromise between the lower levels of risk and the availability of technology and/or economic limitations is sometimes justified.

Several representative quantitative risk assessment studies have been conducted evaluating the risks to human health associated with the use of recycled water for groundwater replenishment. Quantitative "relative" risk assessments (QRRAs) differ from conventional risk assessments in that they calculate doses on the basis of observed concentrations in water and an *assumed* standard water intake in lieu of deriving a site-specific water intake rate, because determinations of absolute exposure in terms of the amount of water consumed in a study population cannot be reliably or easily derived. For example, absolute exposure is impacted by use of bottled water, consuming different water at home rather than at work, population mobility, etc. Thus, a QRRA does not assess the absolute risk from ingestion of water at the tap but rather compares the relative risk of the scenario being evaluated assuming everyone is drinking the same amount of water at the same concentration. This is likely a more conservative approach than using absolute exposure information.

QRRAs were conducted for the Montebello Forebay Project and the Chino Basin Project. The recycled water used for these projects meets the Title 22 Water Recycling Criteria standard for disinfected filtered recycled water and federal and state drinking water MCLs in recycled water before or after surface application. Both of these projects apply recycled water using spreading basins. Dilution waters are also used for replenishment (stormwater, potable water, or other sources of non-wastewater origin) such that the recycled water contributions (RWCs) for the projects range from 35% to 45%.[26] The QRRAs were based on chemicals that are currently regulated or under consideration for regulation (Soller and Nellor, 2011, a,b). Relative human health risks were used to evaluate the potential human health risks rather than using a more traditional approach of making comparisons to drinking water standards because MCLs are based on varying levels of risk. The study evaluated eight years of historical data including approximately 200 chemicals, and identified constituents that were detected in groundwater and had associated health-based criteria such as noncarcinogenic toxicity information and/or cancer slope factors that could be used to quantify the estimated relative potential risk presented by ingestion of groundwater. The wells studied included those with and without recycled water.

[26] The RWC is the ratio of the volume of recycled water applied divided by the sum of the volume of recycled water and dilution water (called diluent water in the Groundwater Replenishment Regulations). For surface application projects, the maximum allowable RWC is also a function of the TOC in recycled water (before or after recharge). For subsurface application projects, the TOC cannot exceed an average of 0.5 mg/L.

The hazard index method was used to assess the overall potential for noncarcinogenic effects. This approach calculated the ratio between the concentration of a detected chemical in groundwater and its toxicity (either the NOAEL or LOAEL). The ratios were added together for all detected chemicals. If the cumulative sum of the added ratios was equal to or greater than unity ("1"), there was a potential risk. If the cumulative sum was less than 1, there was no risk. The QRRAs found that for non-carcinogenic risk, the hazard index for all of the wells was below 1.

The QRRAs also assessed carcinogenic risks. Carcinogenic risks were estimated as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to a potential carcinogen. Probabilistic simulations were conducted to estimate the carcinogenic risk associated with a hypothetical drinking water exposure for the wells under investigation using cancer slope factors. Twenty-five thousand (25,000) individual simulations were carried out for each well. The results of the carcinogenic risk assessment showed no significant difference in risk for groundwater wells with and without recycled water; the carcinogenic risks were in the range of 1 in 100,000.

The results showed that for both groundwater replenishment projects, it was unlikely that recycled water used for groundwater replenishment contributed substantially to the human health risk. Naturally occurring arsenic (not impacted by recycled water used for groundwater replenishment) was the highest contributor to risk in groundwater.

The Orange County Water District (OCWD) in Southern California conducted a QRRA (Soller et al., 2000) using available chemical and microbial data to compare alternative water sources used to replenish the potable Orange County Groundwater Basin. The alternatives considered were Santa Ana River water (which includes a substantial contribution of wastewater from upstream dischargers), Colorado River water (which also includes a substantial contribution of wastewater from upstream dischargers), California State Water Project water, and AWT recycled water. The QRRA found that for non-carcinogenic risk, the hazard index for each type of water was below 1, where 1 is considered the threshold for potential health effects, with the AWT recycled water index lower than the Colorado River and State Water Project waters (imported waters) and the Santa Ana River water. For carcinogenic risks, the risk levels were lower for the AWT recycled water and imported waters in comparison to the Santa Ana River water. Although the levels of arsenic were below the then existing drinking water MCL of 50 µg/L and the then proposed MCL of 10 µg /L, arsenic represented the majority of risk. Arsenic concentrations in the AWT recycled water were 60 times lower than the Santa Ana River water and 35 times lower than the imported water levels. The results also showed that the AWT recycled water was projected to present much less risk than the other waters from bacteria, parasites, and viruses provided that all unit treatment processes in the AWT Facility were fully operational and operating properly.

As part of the NRC's evaluation of potable reuse, the NRC conducted an analysis that was termed as a "risk exemplar," which compared the estimated risks of a common drinking water source generally perceived as safe (but which was comprised of a 5% wastewater component, e.g., *de facto* potable reuse[27]) against the estimated risks of two planned potable reuse scenarios: (1) a deep well in a groundwater aquifer fed by recycled water through soil percolation (receiving soil aquifer treatment or SAT) and (2) a deep well drawing from a groundwater aquifer fed by direct injection of recycled water from an AWT Facility (NRC, 2012). The analysis examined the presence of selected pathogens and trace organic chemicals (for example, chemicals of emerging concern) in final recycled waters from the *de facto* potable reuse scenario and the two potable reuse scenarios to assess whether there are likely to be significantly greater human health concerns from exposure via ingestion to contaminants in these hypothetical reuse scenarios, compared with a common *de facto* reuse scenario. For the chemicals in each of the scenarios, a risk-based action level was used, such as USEPA's MCLs, Australian drinking water guidelines, or World Health Organization drinking water guideline

[27] *De facto* reuse is defined as a drinking water supply that contains a significant fraction of wastewater effluent. This can occur in surface water from upstream discharge of treated wastewater and in groundwater from land disposal of wastewater or discharge from septic tanks. This term is also called unplanned or unintended reuse.

values. Also, a margin of safety was applied, which was defined as the ratio between a risk-based action level (such as an MCL) and the actual concentration of a chemical in recycled water. For microorganisms, the dose-response relationships were used to compute risk from a single day of exposure. The NRC focused on four pathogens commonly of concern in reuse applications and selected 24 chemicals representing different classes of contaminants.

The results showed that following proper design and operational strategies, potable reuse systems can provide protection from trace organic contaminants comparable to what the public experiences in many drinking water supplies today. For microbial agents, the analysis showed that the potable reuse scenarios represented a reduction in microbial risk when compared with the *de facto* reuse example.

### 10.3. Bio-analytical Screening Tools

A number of studies have sought to analyze and compare the toxicological properties of recycled water to those of drinking water; some of these studies attempted to use the combination of toxicology assays and chemical methods to isolate and identify constituents of potential health significance in recycled water used for planned potable reuse. A summary of these projects and related studies is presented in **Table 8**. In general these studies show that bio-analytical methods can be used to evaluate treatment effectiveness, but are not yet ready to evaluate health significance.

**Table 8. Summary of Bio-analytical Screening Studies**

| Project | Types of Water Studied | Health-effects data |
|---|---|---|
| Montebello Forebay Project (Nellor, et al., 1984) | Disinfected tertiary effluent, storm water, and imported river water used for groundwater replenishment; also recovered groundwater. | This study used the Ames *Salmonella* test and mammalian cell transformation assay using organic concentrates of the different waters (concentrated 10,000 to 20,000 times), and subsequent chemical identification was attempted using the Ames assays. Samples were collected from the late 1970s to the early 1980s. The level of mutagenic activity (in decreasing order) was storm runoff > dry weather runoff > tertiary recycled water > groundwater > imported water. No relation was observed between the percentage of tertiary recycled water in wells and observed mutagenicity of residues isolated from wells. The residues did not yield significant cytotoxicity in the mammalian cell assays.<br><br>To facilitate the isolation and identification of the components in sample concentrates, the residues were first fractionated by high performance liquid chromatography followed by testing of the fractions for mutagens and analysis of the mutagenic fractions by gas chromatography-electron ionization mass spectrometry. Results indicated that mutagenicity generally occurred in the least polar (most hydrophobic) fractions of each sample. In most cases, the sum of the mutagenicity in sample fractions was similar in magnitude to that observed in the whole sample. There was no evidence of synergistic effects in these assays. The chemical analysis of mutagenic fractions from 34 samples yielded only four known Ames mutagens in six samples (fluoranthene, benzo(a)pyrene, N-nitrosomorpholine, and N-nitrosopiperidine). However, these compounds were considered to contribute little to the observed overall mutagenicity of the samples. Several unknown compounds detected in the mutagenic fractions could not have caused the mutagenicity in all of the samples, because their frequency of occurrence, distribution in the fractions, and concentrations were not consistent with the bioassay results. Selected sample residues were then evaluated qualitatively by chemical derivatization techniques to determine which classes of compounds might be contributing to the mutagenic activity. Since mutagens are |

| Project | Types of Water Studied | Health-effects data |
|---|---|---|
| | | considered to be electrophilic, two nucleophilic reagents were used to selectively remove epoxide and organohalide mutagens from the residues. Analysis of mutagenic residues of groundwater and replenishment water by negative ion chemical ionization gas chromatography-mass spectrometry and Ames assay before and after derivatization supported (but did not unequivocally prove) the role of at least these two classes of electrophiles in the observed mutagenicity. Several samples had more than 100 reactive components, containing chlorine, bromine, iodine, or epoxides, with concentrations at the part-per-trillion level. However, the structures of these compounds could not be determined, nor were the sources of the compounds identified. Because positive chemical identifications of specific mutagens could not be made and because the estimated concentrations of the components were so low, the biological significance of these materials remained in doubt.<br><br>Follow-up toxicity testing of tertiary recycled water residues in the mid-1990s (not published) showed no Ames test response, while preserved residues from the earlier testing still showed a response indicating that the character of the recycled water has changed over time, perhaps as a result of increased source-control activities. |
| Denver Potable Water Reuse Demonstration Project (Lauer et al., 1996; NRC, 1988) | AWT effluent (with ultrafiltration or RO) and finished drinking water (current supply). The purpose of the project was to evaluate the feasibility of direct potable reuse by producing high quality recycled water; the proposed project was not implemented. | This study used 150 to 500 times organic residue concentrates in 2-year *in vivo* chronic/carcinogenicity study in rats and mice and a reproductive/teratology study in rats. No treatment-related effects were observed. |
| Tampa Water Resource Recovery Project (CH2M Hill, 1993, Pereira et al., undated; NRC, 1988) | AWT effluent (using GAC and ozone disinfection) and Hillsborough River water using ozone disinfection (the current drinking water supply). The proposed project involved augmentation of the Hillsborough River raw water supply; it was not implemented. | This study used Ames *Salmonella*, micronucleus, and sister chromatid exchange tests for three dose levels with organic concentrates (up to 1,000 times). No mutagenic activity was observed in any of the samples. *In vivo* testing included mouse skin initiation, strain A mouse lung adenoma, a 90-day subchronic assay on mice and rats, and a reproductive study on mice. All tests were negative, except for some fetal toxicity exhibited in rats, but not mice, for the AWT sample. |
| Total Resource Recovery Project, City of San Diego (Western Consortium for Public Health, 1996; NRC, 1988; Erickson, 2004) | AWT effluent (RO and GAC) and raw reservoir water (after treatment this is the current drinking water supply). This is a proposed surface water augmentation project that would utilize AWT recycled water to supplement the raw reservoir water. The project and treatment system are currently being re-evaluated. | This study used organic concentrates (150–600 times) in the Ames *Salmonella* test, mouse micronucleus, 6-thoguanine resistance, and mammalian cell transformation assays. The Ames test showed some weak mutagenic activity, but recycled water was less active than the drinking water. The micronucleus test showed positive results only at the high (600 times) doses for both types of water. The 6-thoguanine assay run on whole samples and fractions of each type of water showed no mutagenic effect. The mammalian cell transformation assay, showed a strong response for the reservoir sample, but the single test may not have been significant.<br><br>*In vivo* fish bio-monitoring using fathead minnows (28-day bioaccumulation and swimming tests) showed no positive results. There was greater evidence of bioaccumulation of pesticides in fish exposed to raw water than recycled water. |
| Potomac Estuary Experimental Wastewater Treatment Plant | Study of the wastewater-contaminated Potomac River | This study used 150 times organic concentrates in the Ames *Salmonella* and mammalian cell transformation tests. Results |

| Project | Types of Water Studied | Health-effects data |
|---|---|---|
| (James M. Montgomery, Inc., 1983; NRC, 1988) | Estuary; 1:1 blend of estuary water and nitrified secondary effluent, AWT effluent (filtration and GAC), and finished drinking waters from three water treatment plants. | showed low levels of mutagenic activity in the Ames test, with AWT water exhibiting less activity than finished drinking water. The cell-transformation test showed a small number of positive samples with no difference between AWT water and finished drinking water. |
| Essex & Suffolk Water Langford Recycling Scheme, UK (Walker, 2000) | Secondary treatment, coagulant and polymer addition, sedimentation, nitrification/denitrification in biologically aerated filter, ultraviolet radiation disinfection. | Toxicological tests using fish indicated no significant estrogenic effects |
| Singapore Water Reclamation Study (Kahn and Roser, 2007) | AWT effluent (MF, RO, UV) and untreated reservoir water. The largest amount of Singapore's NeWater is currently used for industrial (semi-conductor manufacturing) and commercial use. At the time the study was conducted, a smaller amount was blended with raw water in reservoirs, which is then treated for domestic use. | Japanese medaka fish (*Oryzias latipes*) testing over a 12-month period with two generations of fish showed no evidence of carcinogenic or estrogenic effects in AWT effluent; however, the study was repeated owing to design deficiencies. The repeated fish study was completed in 2003 and confirmed the findings of no estrogenic or carcinogenic effects.<br><br>Groups of mouse strain (B6C3F1) fed 150 times and 500 times concentrates of AWT effluent and untreated reservoir water over 2 years. The results presented to an expert panel indicated that exposure to concentrated AWT effluent did not cause any tissue abnormalities or health effects. |
| Santa Ana River Water Quality Monitoring Study (Deng, 2008) | Shallow groundwater adjacent to the Santa Ana River and control water.<br>This is an unplanned indirect potable reuse project where the OCWD diverts Santa Ana River water for recharge into the Orange County Groundwater Basin. The Santa Ana River base flow is comprised primarily of tertiary-treated effluent. | Three rounds of testing were conducted in 2004 and 2005. In the first two rounds, Japanese Medaka fish were analyzed for tissue pathology, vitellogenin induction, reproduction, and gross morphology. In the third round, fish were analyzed for vitellogenin induction, reproduction, limited tissue pathology, and gross morphology. In the first two rounds, no statistically significant differences in gross morphological endpoints, gender ratios, tissue pathology, or reproduction were observed between the test water (shallow groundwater adjacent to the Santa Ana River) and the control water. In the third round, no statistically significant differences were observed in reproduction, tissue pathology (limited to evaluation of gonads and ovaries), or vitellogenin induction between the test water and the control water. |
| Soil Aquifer Treatment Study (Fox et al., 2006) | Wastewater (various facilities), soil aquifer treatment water, storm water. | The study used a variety of analytical methods to characterize and measure chemical estrogenicity: *in vitro* methods (estrogen binding assay, glucocorticoid receptor competitive binding assay, yeast-based reporter gene assay, and MCF-7 cell proliferation assay); *in vivo* fish vitellogenin synthesis assay; enzyme-linked immunosorbent assays; and gas chromatography–mass spectrometry. Procedures were developed to extract estrogenic compounds from solids, liquid/liquid methods for direct extraction from aqueous suspensions such as primary and secondary effluents, and concentration of estrogenic (and other) organics on hydrophobic resins followed by organic fractionation during elution in a solvent (alcohol/water) gradient. Field applications of these techniques were designed to measure estrogenic activity derived from conventional wastewater treatment and from SAT. The stability of estrogenic contaminants that are removed on soils SAT was investigated by extracting and measuring nonylphenol from infiltration basin soils as well as by measuring total estrogenic activity in soil extracts. The researchers attempted to separate and measure estrogenic and anti-estrogenic activities in wastewater effluent and conducted a |

| Project | Types of Water Studied | Health-effects data |
|---|---|---|
| | | multi-laboratory experiment in which a variety of wastewater effluents and effluents spiked with known concentrations of specific estrogenic chemicals were tested for estrogenic activity. Significant variability in recycled water estrogenicity was observed in bioassay results. Facilities with the longest hydraulic retention times tended to have the lowest observed levels of estrogenicity. Estrogenicity was efficiently removed during SAT. The study also presented information on the advantages and disadvantages of the bioassay test procedures evaluated. |
| Toxicological Relevance of EDCs and Pharmaceuticals in Drinking Water – Water Research Foundation #3085 (Snyder, 2007; Bruce et al., 2010b) | Drinking water (20 facilities), wastewater (4 facilities - raw and recycled), and food products. | The researchers used an *in vitro* cellular bioassay (E-screen) with a method reporting limit of 0.16 nanograms per liter (ηg/L); results were also converted to estradiol equivalents. The results showed that the vast majority of drinking waters were less than the method reporting limit. The level of estrogenicity (in decreasing order) was food and beverage products (particularly soy based products) > raw wastewater > recycled water > finished drinking water. |

## 11. Role and Activities of the Independent Advisory Panel

MRWPCA has contracted with the National Water Research Institute (NWRI) to form and coordinate the activities of an Independent Advisory Panel (IAP) for a 16-month timeframe to provide expert peer review of the technical, scientific, regulatory, policy, and outreach aspects of the GWR Project. The IAP has been tasked with providing specific input on:

- The proposed treatment technologies and operations, including the design and testing protocol for the pilot system.
- Review of the performance and operations of the pilot system.
- Review of water quality data from the pilot system.
- Feedback on the anticipated water quality of the proposed AWT Facility based on pilot system results.
- Feedback on hydrodynamics, hydrology, and the fate and transport of constituents in the AWT Facility project water after subsurface application.
- Feedback on protection of public health and groundwater quality.
- Feedback on project planning, permitting, and public outreach.

The IAP is comprised of four experts in disciplines relevant to groundwater replenishment projects such as engineering, regulatory criteria, public health, hydrogeology, risk assessment, and other relevant fields. The IAP members are:

- George Tchobanoglous, Ph.D., P.E., NAE; University of California, Davis (Davis, CA)[28]
- Jean-François Debroux, Ph.D., Kennedy/Jenks Consultants (San Francisco, CA)
- Martin B. Feeney, P.G. CHG, Consulting Hydrogeologist (Santa Barbara, CA)[29]
- Michael P. Wehner, MPA, REHS, OCWD (Fountain Valley, CA)[30]

[28] Ph.D. – Doctor of Philosophy, P.E. – Professional Engineer, NAE – National Academy of Engineering.
[29] P.G. – Professional Geologist, CHG – Certified Hydrogeologist.
[30] MPA – Masters of Public Administration, REHS – Registered Environmental Health Specialist.

The IAP held two meetings (October 2013 and May 2014) and provided two reports on their findings and recommendations. Topics reviewed included source water characterization; the preliminary results of the pilot testing; information on groundwater quality, groundwater modeling, and the vadose zone leaching analysis; public outreach; water rights; and source control. The IAP also reviewed and provided input on the conceptual project proposal submitted to DDW.

## 12. Proposed Groundwater Replenishment Project Treatment Design

Treatment for the GWR Project would be provided by the RTP's existing primary and secondary treatment processes and the new AWT Facility as described below. A description and analysis of the treatment provided for the SVRP for tertiary recycled water for the Castroville Seawater Intrusion Project area is not provided herein, but is provided in the Water and Wastewater Section of the EIR.

### 12.1. Regional Treatment Plant and New Source Waters

The existing RTP would provide primary and secondary treatment, the latter of which consists of non-nitrifying trickling filters, bioflocculation, and clarification. The RTP currently receives and treats approximately 17 to 18 mgd of residential, commercial, industrial wastewater and also accepts some dry weather urban runoff, septage, and other discrete wastewater flows. It has an average dry weather design capacity of 29.6 mgd and a peak wet weather design capacity of 75.6 mgd; therefore, the RTP has capacity to treat additional flows. As part of the GWR Project, new source waters will be diverted to the MRWPCA sewer collection system and combined with municipal wastewater for treatment at the RTP. The new source waters would be:

- Monterey Peninsula urban stormwater and runoff, including water that flows into Lake El Estero;
- City of Salinas urban stormwater and runoff from the southwest portion of the city;
- Salinas agricultural wash water, 80 to 90% of which is water used for washing produce;
- Urban and agricultural runoff and tile drainage water from the Reclamation Ditch and Tembladero Slough (to which the Reclamation Ditch is tributary); and
- Water from the Blanco Drain, an artificial, open-channel, drainage ditch that collects agricultural tile drainage from approximately 6,400 acres of agricultural lands near Salinas.

### 12.2. Advanced Water Treatment Facility

The proposed new AWT Facility would have a design capacity to produce 4.0 mgd of purified water. The facility would be operated to produce up to 3,500 AFY of purified water for injection.

***Pilot Testing of the Advanced Treatment Facility***

The AWT Facility would provide full advanced treatment (treatment of secondary effluent by MF, RO, and AOP) as required in the State's Groundwater Replenishment Regulations for subsurface application projects. The AWT Facility would also include ozone as membrane pretreatment and post-treatment stabilization after AOP.  If needed, a BAF process can be added to the AWT Facility following the ozone treatment process.

A pilot plant testing  program was conducted between mid-October 2013 and mid-July 2014, with extensive sampling conducted between December 2013 and June 2014.  The pilot facility treated a flow of 30 gallons per minute (gpm) of undisinfected RTP secondary effluent with the goals of (1) evaluating the performance of the ozone-MF-RO portion of the AWT Facility processes, and (2) developing design criteria for each unit process.  Although AOP will be included in the AWT Facility, it was not included in the pilot testing and sampling program as design of an AOP system typically does not require a pilot demonstration and sufficient information on treatment efficacy is available from existing groundwater replenishment projects. During the pilot testing and the source water sampling campaign, agricultural wash water was diverted to the RTP as influent to the headworks and mixed with municipal wastewater from April 1, 2014 through the end of the sampling program.[31] Data from this period are reflective of the blended water quality of these two sources. The results of the pilot testing are presented later in the report.

The three main design parameters investigated in the pilot were:

- Ozone dose: High concentrations of large organic molecules present in the RTP secondary effluent result in MF fouling, which reduces the flux[32] through the membrane treatment systems; ozone pretreatment can increase MF flux by breaking down these large molecules. The optimal ozone dose would allow for a higher MF flux without generating excess ozone.
- MF flux: Standard practice is to pilot MF systems to develop the design flux, which is influenced by the quality of water undergoing treatment and by pretreatment, such as ozone.
- RO recovery: This refers to the proportion of RO influent that becomes feedwater to the AOP system (RO permeate) versus the fraction of the influent that will be a waste stream containing the concentrated contaminants by RO (RO concentrate). Theoretical demonstrations of RO recovery are limited; thus, RO piloting is necessary to increase confidence in the design recovery of the RO system.

***Description of the Advanced Water Treatment Facility***

The AWT Facility would receive secondary effluent from the RTP for treatment. The following is a list of the proposed AWT Facility structures and facilities:

- Inlet source water diversion facilities to bring secondary effluent to the AWT Facility;
- Advanced treatment process facilities, including
  - Ozonation.
  - Biologically active filtration (optional).
  - MF treatment.
  - Booster pumping of the membrane filtration filtrate (with intermediate storage).
  - Cartridge filtration.
  - Chemical addition.
  - RO membrane treatment.
  - AOP using UV and hydrogen peroxide.
  - Decarbonation.
  - Stabilization with calcium, alkalinity and pH adjustment.
- Final purified water storage and distribution pumping.
- Brine mixing facilities.

**Figure 3** provides a simplified process flow diagram illustrating the proposed treatment facilities.

[31] Source water was sampled in September 2013 prior to the beginning of the pilot testing.
[32] Flux is the flow rate through an individual membrane filter module expressed per unit of membrane surface area.

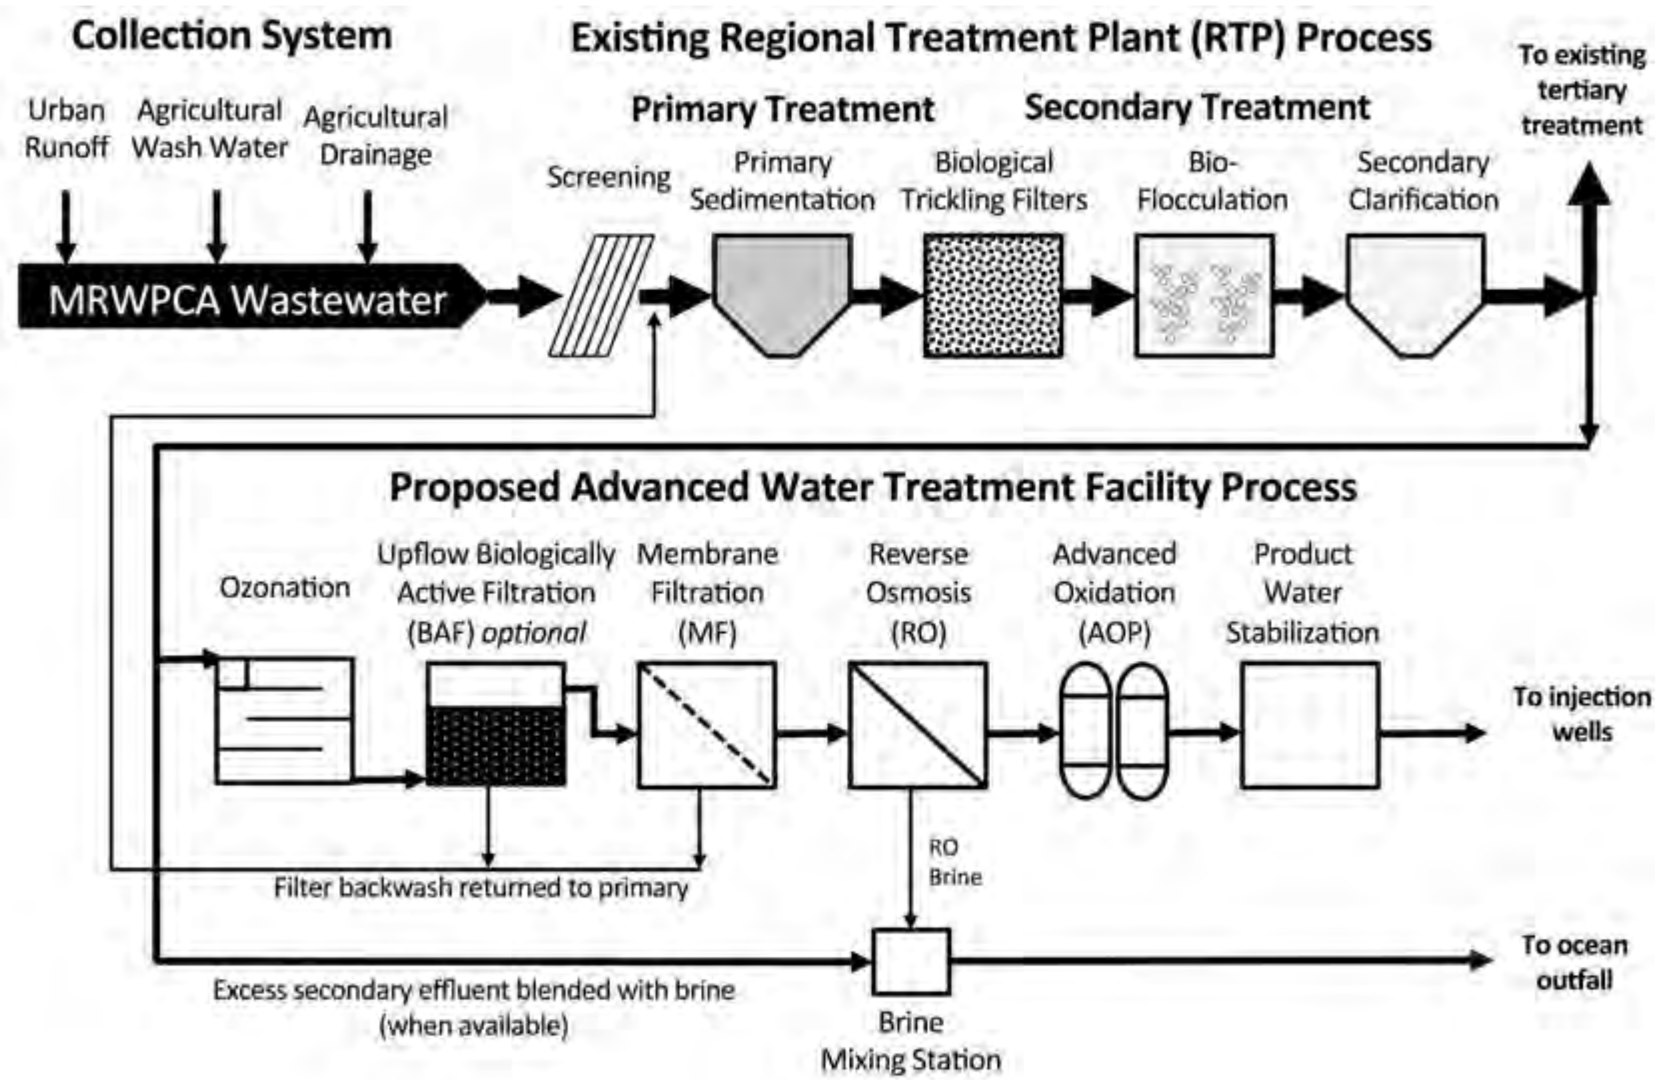

**Figure 3. Simplified Flow Schematic of Regional Treatment Plant and Proposed Advanced Water Treatment Facility Processes**

# 13. Summary of the Groundwater Replenishment Project Water Quality and Compliance with Groundwater Replenishment Regulations and Central Coast Basin Plan

This Section summarizes the water quality requirements for groundwater replenishment via subsurface application of recycled water pursuant to (1) the 2014 Groundwater Replenishment Regulations and (2) Central Coast Region Basin Plan, as well as the GWR Project's ability to meet these water quality requirements. This analysis was conducted using water quality data for source waters[33] to the AWT Facility, data from the pilot plant testing that evaluated several of the AWT Facility processes (ozone, MF, and RO) for the removal of selected parameters, and documented removal efficiencies for the proposed AWT Facility processes. In addition to the AWT Facility processes piloted, the GWR Project would also include AOP using hydrogen peroxide and UV and water stabilization following AOP.

## 13.1. <u>Water Quality Requirements Specified in the Groundwater Replenishment Regulations</u>

The Groundwater Replenishment Regulations (SWRCB, 2014) specify compliance with recycled water quality requirements, including controls for microbial pathogens (virus, *Giardia*, and *Cryptosporidium*), compliance with drinking water standards for regulated chemicals, and controls for nitrogen and unregulated chemicals. More specifically, the recycled water used for subsurface application must comply with the following:

- Pathogenic microorganism treatment requirements: the wastewater must receive treatment that achieves at least 12-log enteric virus reduction, 10-log *Giardia* cyst reduction, and 10-log *Cryptosporidium* oocyst reduction using at least three treatment barriers, including residence time underground for virus
- Primary MCLs in the CCR, Title 22:
  - inorganic chemicals in Table 64431-A, except for nitrogen compounds
  - radionuclide chemicals in Tables 64442 and 64443
  - organic chemicals in Table 64444-A-A
  - disinfection byproducts in Table 644533-A
- Secondary MCLs in CCR, Title 22, Tables 64449-A and 64449-B (upper limit)
- Title 22 action levels for lead and copper
- Other constituents:
  - 10 mg/L total nitrogen
  - 0.5 mg/L TOC
- NLs[34]

---

[33] Secondary-treated effluent from the RTP would be the major source water for the AWT Facility. Additional sources of water will be diverted into the existing MRWPCA wastewater collection system and treated by the RTP's primary and secondary processes. These additional source waters include: Lake El Estero and City of Salinas urban stormwater and runoff; Salinas agricultural wash water; and agricultural and other drainage waters from the Blanco Drain, Tembladero Slough, and the Reclamation Ditch. Although Lake El Estero has been proposed as a potential source water, its use would only occur if all other sources do not provide adequate quantities for the recycled water needs. In addition, under the GWR Project its contribution to total influent flows to the RTP would be small (maximum 6% in some circumstances, with a monthly average of 2% only in a very dry year). Excess wastewater that has been treated to a secondary level at the RTP that would otherwise be discharged to the ocean would be included as feed water to the AWT Facility.

[34] The NL requirements are more complex than a single exceedance of the numeric NL. The purified water used for replenishment is monitored quarterly for NLs with accelerated monitoring initiated if the result is greater than an NL. If the running 4-week average is greater than the NL for 16 consecutive weeks, the project sponsor must notify DDW and RWQCB and the project sponsor must take corrective actions.

## 13.2. Source Water Monitoring

A one-year monitoring program from July 2013 to June 2014 was conducted for five of the potential source waters. Regular monthly and quarterly sampling was carried out for the RTP secondary effluent, agricultural wash water, and Blanco Drain drainage water. Limited sampling of stormwater from Lake El Estero was performed due to seasonal availability, and there was one sampling event for the Tembladero Slough drainage water.[35]

### *Pathogenic Microorganisms*

To protect public health, groundwater replenishment projects must inactivate or remove pathogenic microorganisms from the wastewater that is treated to produce recycled water prior to distribution. The Groundwater Replenishment Regulations require minimum pathogenic reductions of 12, 10, and 10 logs for viruses, *Giardia* cysts, and *Cryptosporidium* oocysts, respectively.

During the 2013 to 2014, source waters were monitored for *Cryptosporidium* oocysts*, Giardia* cysts*,* total coliform, and *E. coli*. The source waters were not monitored for viruses as part of the pilot testing based on the expected low number of indigenous virus expected to be present in runoff (Rajal et al., 2007) and RTP secondary effluent (Rose et al., 2004). Instead, indicator bacteria (total coliform and E. *coli*) were used as surrogates for virus. A summary of the concentrations of pathogens and indicator organisms measured in the source waters is presented in **Table 9**. The concentrations of pathogens and indicator organisms are typical of a non-disinfected secondary effluent and are well below the pathogen concentrations that DDW assumed when developing the pathogen control requirements as part of the Groundwater Replenishment Regulations.

**Table 9. Summary of Pathogens Measured in Source Waters**

| Parameter[a] | Undisinfected RTP Secondary Effluent N = 12[b] | Agricultural Wash Water N = 10 | Blanco Drain N = 11 | Lake El Estero N = 2 | Tembladero Slough N = 1 |
|---|---|---|---|---|---|
| *Cryptosporidium*[c] (oocysts/L) | 0.38 (<0.10 – 0.9) | <0.33 | 0.185 (<0.18 – 0.2) | <0.3 | <0.09 |
| *Giardia*[c] (cysts/L) | <0.1 (<0.1 – 0.2) | <0.33 | <0.18 | <0.3 | <0.09 |
| Total coliform[d] (MPN[2]/100 mL) | $7.1x10^5$ ($1.9x10^5$ – $1.6x10^6$) | $7.7x10^6$ ($6.2x10^5$ –$9.6x10^7$) | $4.3x10^4$ ($8.4x10^3$ –$2.0x10^6$) | $3.5x10^3$ | $1.7x10^5$ |
| *E. coli*[d] (MPN/100 mL) | $1.8x10^5$ ($2.9x10^4$ –$5.8x10^5$) | <20 (<20 – 18) | $2.4x10^2$ (75 – $2x10^3$) | <100 | $7.5x10^2$ |

a. N is the number of samples.
b. Four of the samples included diversion of agricultural wash water mixed with sewage and treated at the RTP.
c. Values are median values and data range (minimum concentration to maximum concentration) where applicable.
d. Values are geometric means with the observed range (minimum concentration to maximum concentration) where applicable.

The source waters that were sampled are all expected to have a lower pathogenic microorganism count than raw municipal wastewater. Therefore, adding the new source waters would not increase the concentrations of these organisms; the RTP and AWT Facility treatment technologies typical for groundwater replenishment projects would remove these organisms as demonstrated by existing groundwater replenishment projects elsewhere, and as discussed later in the report based on the pilot testing.

[35] A Salinas stormwater sample was collected on December 2, 2014 and analyzed for an abridged set of chemical parameters, but these data were not included in this assessment.

***Water Quality Constituents***

The 2013-2014 source water sampling and pilot study included a detailed characterization of the source waters (RTP effluent, agricultural wash waster, and Blanco Drain on a quarterly basis; Lake El Estero and Tembladero Slough one time each), with an expanded monitoring list for pesticides given the high levels of agricultural activity in the area. The source water sampling and monitoring analysis was designed to assess the full list of water quality parameters – including many not required to be monitored for groundwater replenishment projects. The types of constituents that were included in the source water monitoring program are the following:

- General water quality parameters, including total nitrogen and TOC
- Constituents with California Primary and Secondary MCLs
  - Inorganic chemicals
  - Organic chemicals
  - Disinfection by-products (DBPs)
  - Radionuclides
- Constituents with California action levels for lead and copper
- Constituents with California NLs
  - Current NLs as of December 14, 2010
  - Archived Advisory Levels (AALs)[36]
- Priority Pollutants
- Constituents included in the USEPA Unregulated Contaminant Monitoring Rule (UCMR) Lists 1, 2 and 3 (excluding pathogenic organisms)
- Pesticides of local interest (PoLi) based on the agricultural activity/usage in the area[37]
- CECs

As previously noted, the Groundwater Replenishment Regulations include numeric water quality criteria for primary and secondary MCLs, action levels for lead and copper, total nitrogen, and TOC. The Groundwater Replenishment Regulations include requirements for numeric NLs based on the results of monitoring recycled water. For purposes of this project, the numeric NLs were used as compliance goals. Therefore, the source waters were analyzed for the constituents (also referred to as analytes) with regulatory criteria and goals.

The Groundwater Replenishment Regulations also require that the recycled water be monitored for additional constituents, but do not specify numeric criteria for the following: priority pollutants; chemicals specified by DDW based on the Engineering Report, affected groundwater basin, and source control program; and indicator chemicals to characterize the presence of CECs. Although the Groundwater Replenishment Regulations do not require monitoring for AALs, contaminants included in the UCMR, PoLi, or all of the CECs sampled in the source waters, they were included in the source water sampling program to provide a comprehensive data set to evaluate source water quality and the performance of the pilot system.

During source water sampling and pilot testing programs, the sampling program evaluated a total of 435 analytes, including constituents with and without regulatory criteria/goals. Of these, 194 analytes were detected in at least one sample, and 241 were below detection limits in all of the source waters. The median

[36] Per the H&S Code, advisory levels were renamed as NLs.
[37] Many of these constituents had applicable MCLs or AALs, and thus are addressed under those regulatory requirements/goals.

concentration and concentration range of each analyte, as well as number of samples with positive detections, are provided in Appendix B. Some analytes are listed more than once in the appendix because different analytical techniques were used to determine their concentrations.

As previously noted, the GWR Project includes the collection of a variety of new source waters that would be combined with existing incoming wastewater flows for conveyance to and treatment at the RTP. Constituent reduction prior to use of the purified water for replenishment would occur in two ways.

1. In many cases, the blending of waters prior to treatment at the RTP would reduce concentrations of some constituents in each source water. The average flow of municipal wastewater currently receiving primary and secondary treatment at the RTP is approximately 17 mgd in comparison to an annual total of 7.6 mgd for the other source waters. Based on a combined total flow of 24.6 mgd, the new source waters would represent 31% of the flow, with seasonal differences (e.g., less source water in the winter and more during the summer). The estimated quantities of source waters that would be mixed with the RTP municipal wastewater influent and receive primary and secondary treatment prior to treatment in the AWT Facility are provided in Appendix C.
2. Some constituents in the new source waters would be reduced prior to reaching the AWT Facility through the RTP primary and secondary treatment.
3. The secondary treated wastewater that is not sent to the SVRP tertiary treatment plant for agricultural irrigation would be treated at the AWT Facility, which would include ozonation, BAF (optional), MF, RO, AOP using UV/peroxide, and water stabilization. These treatment technologies are typical for groundwater replenishment projects and would effectively remove these constituents as demonstrated by existing groundwater replenishment projects elsewhere and as discussed in the following sections of this report.

***Constituents with Maximum Contaminant Levels and Notification Levels***

During the pilot study, two monitoring frequencies were used for source water monitoring: (1) quarterly monitoring of all parameters to understand occurrence of the various constituents, and (2) monthly monitoring of a select list of constituents for understanding the variability of key design parameters. The quarterly sampling list for constituents/parameters with primary MCLs, secondary MCLs, and NLs are listed in **Table 10**, **Table 11**, and **Table 12**, respectively.

**Table 10. Constituents with Primary Maximum Contaminant Levels Included in the Source Water Monitoring**

| | | |
|---|---|---|
| 1,1-Dichloroethane | Carbon Tetrachloride | Nickel |
| 1,1-Dichloroethylene | Chlordane | Nitrate[a] |
| 1,1,1-Trichloroethane | Chlorite | Nitrate+Nitrite[a] |
| 1,1,2-Trichloro-1,2,2-Trifluoroethane | Chromium | Nitrite (as N)[a] |
| 1,1,2-Trichloroethane | cis-1,2-Dichloroethylene | Oxamyl |
| 1,1,2,2-Tetrachloroethane | Cyanide | Pentachlorophenol |
| 1,2-Dichlorobenzene | Dalapon | Perchlorate |
| 1,2-Dichloroethane | Di(2-ethylhexyl)adipate | Picloram |
| 1,2-Dichloropropane | Di(2-ethylhexyl)phthalate | Polychlorinated Biphenyls |
| 1,2,4-Trichlorobenzene | Dibromochloropropane | Radium-226 |
| 1,3-Dichloropropene | Dichloromethane | Radium-228 |
| 1,4-Dichlorobenzene | Dinoseb | Selenium |
| 2,3,7,8-TCDD | Diquat | Simazine |
| 2,4-D | Endothall | Strontium-90 |
| 2,4,5-TP | Endrin | Styrene |
| Alachlor | Ethylbenzene | Tetrachloroethylene |
| Aluminum | Ethylene Dibromide | Thallium |
| Antimony | Fluoride | Thiobencarb |
| Arsenic | Glyphosate | Toluene |
| Asbestos | Gross Alpha Particle | Total Haloacetic acids |
| Atrazine | Heptachlor | Toxaphene |
| Barium | Heptachlor Epoxide | Total trihalomethanes |
| Bentazon | Hexachlorobenzene | trans-1,2-Dichloroethylene |
| Benzene | Lindane | Trichloroethylene |
| Benzo(a)pyrene | Hexachlorocyclopentadiene | Trichlorofluoromethane |
| Beryllium | Mercury | Tritium |
| Beta/photon emitters (K40 adjusted) | Methoxychlor | Uranium |
| Bromate | Methyl-tert-butyl ether | Vinyl Chloride |
| Cadmium | Molinate | Xylenes |
| Carbofuran | Monochlorobenzene | |

a. The Groundwater Replenishment Regulations do not require that the MCLs for nitrate, nitrite, and nitrate + nitrite be met. The regulations require that the total nitrogen concentration in the recycled water not exceed 10 mg/L as nitrogen (N). However, also see later discussion in the report regarding compliance with Basin Plan MCL-based groundwater objectives, which include nitrate, nitrite, and nitrate+nitrite.

**Table 11. Constituents with Secondary Maximum Contaminant Levels Included in the Source Water Monitoring**

| | | |
|---|---|---|
| Aluminum | Iron | Thiobencarb |
| Chloride | Manganese | Total Dissolved Solids |
| Color | Methyl-tert-butyl ether | Turbidity |
| Conductivity | Odor-Threshold | Zinc |
| Copper | Silver | |
| Foaming Agents | Sulfate | |

**Table 12. Constituents with Notification Levels Included in the Source Water Monitoring**

| | |
|---|---|
| 1,2,3-Trichloropropane | ***Nitrosamines (List of 9)*** [a] |
| 1,2,4-Trimethylbenzene | N-nitrosodi-n-propylamine |
| 1,3,5-Trimethylbenzene | N-nitrosodiethyamine |
| 1,4-Dioxane | NDMA |
| 2-Chlorotoluene | N-nitroso-di-n-butylamine |
| 2,4,6-Trinitrotoluene | N-nitrosodiphenylamine |
| 4-Chlorotoluene | N-nitrosomorpholine |
| Boron | N-nitrosopiperidine |
| Carbon disulfide | N-nitroso-methylethylamine |
| Chlorate | N-nitrosopyrrolidine |
| Diazinon | Naphthalene |
| Dichlorodifluoromethane (Freon 12) | n-Propylbenzene |
| Ethylene glycol | Propachlor |
| Formaldehyde | RDX (Hexahydro-1,3,5-trinitro-1,3,5-triazine) |
| HMX (or Octogen) | sec-Butylbenzene |
| Isopropylbenzene | tert-Butylbenzene |
| Manganese | Tertiary butyl alcohol |
| Methyl isobutyl ketone | Vanadium |
| n-Butylbenzene | |

a. DDW NLs include only three nitrosamines: N-nitrosodiethyamine, NDMA, and N-nitrosodi-n-propylamine; the source water monitoring included a total of nine nitrosamine compounds.

A summary of the numbers of constituents/parameters with MCLs, NLs, and AALs detected[38] in each of the "untreated" source waters is presented in **Table 13**. In this context, untreated means the following:

- For the RTP effluent, prior to AWT Facility treatment.
- For the other source waters, prior to treatment at the RTP/AWT Facility.

Table 5 also includes the numbers of constituents above their relevant regulatory limits, NLs or AALs. It is noted that in many cases, the constituents were detected above their regulatory limits in one or more of the untreated source waters. Therefore, the numbers in each category are not additive.

**Table 13. Number of Constituents with Maximum Contaminant Levels and Notification Levels Detected in Untreated Source Waters**

| Source Water | Number of Constituents Detected | | | |
|---|---|---|---|---|
| | Primary MCLs | Secondary MCLs | NLs | AALs |
| RTP Effluent | 12<br>(1)[a] | 12<br>(6) | 9<br>(1) | 3<br>(0) |
| Agricultural Wash Water | 20<br>(5) | 12<br>(8) | 9<br>(2) | 2<br>(0) |
| Blanco Drain | 15<br>(2) | 12<br>(9) | 6<br>(0) | 3<br>(1) |
| Lake El Estero | 12<br>(0) | 11<br>(7) | 5<br>(0) | 0 |
| Tembladero Sough | 13<br>(2) | 9<br>(8) | 3<br>(0) | 1<br>(0) |

a. Numbers in parentheses are the number of analytes detected (at least once) above a regulatory limit or advisory level.

[38] Detected means that the concentration was above the Minimum Reporting Level (MRL). The MRL represents an estimate of the lowest concentration of a compound that can be detected in a sample for which the concentration can be quantified and reported with a reasonable degree of accuracy and precision.

**Table 14** provides the concentrations of constituents with primary and secondary MCLs that were determined to be above their regulatory limits in at least one sample in any of the untreated source waters. Very few constituents were above primary or secondary MCLs in the various untreated source waters. For the NLs, only two constituents were found in two of the five untreated source waters (RTP effluent and agricultural wash water) above the current NLs as shown in Table 14. For the AALs, only three constituents were detected with one above the advisory level (see **Table 15**). Treatment would occur through the primary and secondary processes at the RTP and AWT Facility. These treatment technologies are typical for groundwater replenishment projects and would remove these constituents to below regulatory levels and goals as demonstrated by existing groundwater replenishment projects elsewhere and as discussed later in the report.

**Table 14. Constituents with Maximum Contaminant Levels Above Regulatory Limits in at Least One Sample of Any of the Untreated Source Waters**

| Source Water | Comparison to Primary MCLs | | | Comparison to Secondary MCLs | | |
|---|---|---|---|---|---|---|
| | Constituent | Primary MCL | Highest Concentration Detected | Constituent | Secondary MCL | Highest Concentration Detected |
| RTP Effluent | Di(2-ethylhexyl)phthalate | 4 µg/L | 78 µg/L | Color | 15 units | 75 units |
| | | | | Conductivity (Specific Conductance) | 900 µS/cm[a] | 1623 µS/cm |
| | | | | Iron | 0.3 mg/L | 0.537 mg/L |
| | | | | Odor-Threshold | 3 units | 200 units |
| | | | | TDS | 500 mg/L[b] | 803 mg/L |
| | | | | Aluminum | 0.2 mg/L | 0.256 mg/L |
| Agricultural Wash Water | Fluoride | 2 mg/L | 31.9 mg/L | Chloride | 250 mg/L[c] | 292 mg/L |
| | 1,3-Dichloropropene | 0.5 µg/L | 0.7 µg/L | Color | 15 units | 175 units |
| | Di(2-ethylhexyl)phthalate | 4 µg/L | 16 µg/L | Conductivity (Specific Conductance) | 900 µS/cm[a] | 1830 µS/cm |
| | Total haloacetic acids (HAAs) | 60 µg/L | 390 µg/L | Iron | 0.3 mg/L | 0.875 mg/L |
| | Total trihalomethanes | 80 µg/L | 160 µg/L | Odor-Threshold | 3 units | 350 units |
| | | | | TDS | 500 mg/L[b] | 1594 mg/L |
| | | | | Turbidity | 5 NTU | 72 NTU |
| | | | | Aluminum | 0.2 mg/L | 0.598 mg/L |
| Blanco Drain | Aluminum | 1 mg/L | 2.04 mg/L | Chloride | 250 mg/L[c] | 307 mg/L |
| | 1,3-Dichloropropene | 0.5 µg/L | 0.62 µg/L | Color | 15 units | 85 units |

| RTP Effluent | NDMA | 10 ηg/L | 16 ηg/L | None | --- | --- |
| Agricultural Wash Water | Formaldehyde<br>NDMA | 100 µ/L<br>10 ηg/L | 120 µg/L<br>340 ηg/L | None | --- | --- |
| Blanco Drain | None | --- | | Dieldrin | 0.002 µg/L | 0.028 µg/L |
| Lake El Estero | None | --- | -- | None | --- | --- |
| Tembladero Slough | None | --- | -- | None | --- | --- |

### *Lead and Copper Action Levels*

The Groundwater Replenishment Regulations require that recycled water not exceed the action levels for lead and copper, which are 0.015 mg/L and 1.3 mg/L, respectively. The maximum concentrations of lead and copper measured in any of the untreated source waters was 0.0018 mg/L, and 0.073 mg/L, respectively. Thus, the source water sampling program found that lead and copper were below their respective action levels in all of the untreated source waters sampled. Further, the GWR Project would include post-treatment water stabilization, which would control corrosion.

### *Total Organic Carbon*

The Groundwater Replenishment Regulations require that, prior to injection, the TOC concentration in recycled water not exceed 0.5 mg/L, based on the 20-week running average of all TOC results and the average of the last four TOC results. As shown in **Table 16**, the median concentration and range of TOC in the various untreated source waters are similar except for the agricultural wash water, which has a significantly higher TOC concentration. However, all of the untreated source waters would undergo treatment through the primary and secondary processes at the RTP and advanced treatment at the AWT Facility. These treatment technologies are typical for groundwater replenishment projects and would produce TOC concentrations at or below 0.5 mg/L as demonstrated by existing groundwater replenishment projects elsewhere. The MF and RO membranes are the primary barriers for TOC removal. During the piloting program (described later) the TOC concentration in the RO permeate consistently was less than 0.5 mg/L when the system was operated in a manner consistent with how the full-scale system would be operated.

**Table 16. Summary of Total Organic Carbon Concentrations Measured in Untreated Source Waters**

| Parameter[a] | RTP Effluent | Agricultural Wash Water | Blanco Drain | Lake El Estero | Tembladero Slough |
|---|---|---|---|---|---|
| TOC (mg/L) | 15<br>(12-17) | 295<br>(66-340) | 3<br>(2.5-11) | 14 | 8.8 |

a. Median values and data range (minimum concentration to maximum concentration) where applicable.

***Total Nitrogen***

The Groundwater Replenishment Regulations require that the applied recycled water not exceed a total nitrogen concentration of 10 mg/L. Samples may be collected before or after subsurface application. As indicated in **Table 17**, the total nitrogen concentration in untreated Lake El Estero water meets the requirement, while the other untreated source waters do not. However, after treatment at the AWT Facility, all of the source waters would meet the total nitrogen requirement based on the treatment technologies to be provided that are typical for groundwater replenishment projects and as demonstrated by existing groundwater replenishment projects elsewhere. The average total nitrogen removal observed through the piloting program (described later) was 94.3%, which is sufficient to reduce these concentrations to levels below 10 mg/L. The principal AWT Facility nitrogen removal mechanism would be reduction through the RO membranes.

**Table 17. Summary of Total Nitrogen Concentrations in Untreated Source Waters**

| Parameter[a] | RTP Effluent | Agricultural Wash Water | Blanco Drain | Lake El Estero | Tembladero Slough |
|---|---|---|---|---|---|
| Total nitrogen (mg/L as N) | 44.2<br>(35.7-50.5) | 25.3<br>(19-51.1) | 70.1<br>(63-77.3) | 1.3 | 58 |

a. Median values and data range (minimum concentration to maximum concentration) where applicable.

***Priority Pollutants***

The Groundwater Replenishment Regulations require that recycled water and groundwater (from downgradient monitoring wells) be monitored for priority pollutants (chemicals listed in 40 CFR Section 131.38, "Establishment of numeric criteria for priority toxic pollutants for the State of California") specified by DDW, based on the DDW's review of the project's engineering report. A total of 32 of the 126 priority pollutants were detected during source waters sampling. Of the 32 chemicals detected, 19 were chemicals with either MCLs or NLs. As described later, 16 priority pollutants were found in the RO permeate after the pilot testing all of which had MCLs or NLs.

### 13.3. Pilot Plant Results and Compliance with Groundwater Replenishment Regulations

***Pathogenic Microorganisms***

The Groundwater Replenishment Regulations grant log reduction credits for unit processes that have been demonstrated to remove pathogens under expected operating conditions. The proposed pathogen reduction credits for the unit processes in the full-scale AWT Facility are shown in **Table 18**, and have conceptually been approved by DDW. The log reduction credits listed in the table are typical of what other advanced water treatment facilities in California operating under similar conditions have achieved. The AWT Facility is expected to achieve log reduction credits of 13.5, 11.5, and 11.5 for viruses, *Giardia* cysts, and *Cryptosporidium* oocysts, respectively, which exceed the minimum log reduction requirements in the Groundwater Replenishment Regulations. The extra credits, not including additional credits that can be granted for primary and secondary treatment at the RTP, will provide additional redundancy of pathogenic microorganisms removal to achieve the total credits required by the Groundwater Replenishment Regulations.

**Table 18. Proposed Pathogen Reduction Credits for the Proposed Full-scale Advanced Water Treatment Facility Processes**

| Process | Conditions | Log Reduction Credits | | |
|---|---|---|---|---|
| | | Virus | *Giardia* | *Crypto* |
| Ozone[a] | Not pursing credit for ozone | 0 | 0 | 0 |
| MF | Daily pressure decay test | 0 | 4 | 4 |
| RO | Online TOC or conductivity monitoring | 1.5 | 1.5 | 1.5 |
| UV/Peroxide | 1,000 $mJ/cm^{2}$[(b)] | 6 | 6 | 6 |
| Underground Residence Time | 6-month underground residence or retention time[c] | 6[b] | 0 | 0 |
| **Regulatory Requirement** | | **12** | **10** | **10** |
| **Total Credits Achieved by Proposed AWT Facility Processes** | | **13.5** | **11.5** | **11.5** |

a. Ozone CT (contact time multiplied by ozone residual) may be included in the future if additional credit for redundancy is needed.
b. Millijoule per square centimeter ($mJ/cm^2$).
c. Groundwater modeling has demonstrated an estimated underground retention time for the GWR Project of a minimum of 327 days from injection to extraction and 5.5-log credit (Todd Groundwater, 2015b). Tracer testing to be conducted after project startup is expected to show the actual retention time to be equal to or greater than 6 months to achieve the 6-log credit.

Pilot plant testing of the ozone, MF, and RO portion of AWT Facility processes was conducted to evaluate the reduction of *Cryptosporidium* oocysts, *Giardia* cysts, total coliforms, and *E. coli*. The influent to the pilot plant treatment train was secondary effluent from the RTP. As indicated in **Table 19**, pathogen and indicator organism levels were observed to be below detection after treatment by the pilot plant. In addition, the UV/peroxide AOP, which was not included in the pilot testing, would be designed for 6-logs of removal credit for viruses, *Cryptosporidium oocysts*, and *Giardia cysts*.

**Table 19. Summary of Pathogen and Indicator Removal Observed Through the Pilot Plant**

| Pathogen/Indicator[a] | Pilot Influent | Ozone Effluent | MF Effluent | RO Permeate |
|---|---|---|---|---|
| *Cryptosporidium* (oocysts/L) | 0.35 (<0.09-0.9) | *2.65*[b] (0.3-23.3) | <0.09 | -- |
| *Giardia* (cysts/L) | 0.15 (<0.09-1.1) | <0.2[b] (<0.09-4.4) | <0.09 | -- |
| Total coliform[c] (MPN/100 mL) | $2.8x10^5$ ($2.4x10^3 – 1.6x10^6$) | $6.3x10^2$ ($5.5x10^1 – 3.1x10^3$) | <1 | <1 |
| *E. coli*[c] (MPN/100 mL) | $6.0x10^4$ ($4.9x10^2 – 3.3x10^5$) | $2.7x10^1$ ($<1 – 5.5x10^2$) | <1 | <1 |

a. Median values and data range (minimum concentration to maximum concentration) where applicable.
b. There were consistently higher *Cryptosporidium* concentrations in the ozone effluent than the pilot influent. This effect appears to be an artifact of the method of sampling and water quality analysis. The ozonation of the water likely increased the method recovery for *Cryptosporidium* since ozone made it easier to detect protozoa in the samples.
c. Values are geometric means with the observed range (minimum – maximum) where applicable. Most probable number per 100 milliliters (MPN/100 mL).

The data in Tables 18 and 19 clearly indicate that the GWR Project would meet all of the pathogen control requirements specified in the Groundwater Replenishment Regulations. Based on the results of the source water testing and pilot performance, the inclusion of the additional source waters not used/treated by the pilot testing would also be able to be treated to meet the regulations because they had lower concentrations of pathogens than the municipal wastewater.

***Constituents with Maximum Contaminant Levels***

A summary of the constituents detected in RO permeate with primary and secondary MCLs, is presented in **Table 20**. Fourteen constituents with MCLs were detected in the RO permeate at least once as shown in Table 20, and with the exception of the odor threshold secondary MCL, none of them exceeded their regulatory limit. For the full-scale AWT Facility, odor would be reduced to levels below the MCL after UV/peroxide AOP treatment (Agus et al., 2011). Thus, results of the pilot testing based on the ozone-MF-RO portion of the AWT Facility and the expected benefit from full-scale treatment with AOP show that the water treated by RO and AOP would comply with all of the MCLs that are required to be met for groundwater replenishment of recycled water. Based on the results of the source water testing (e.g., the types of constituents detected above the MCLs) and pilot performance for these constituents, the inclusion of the additional source waters not used/treated by the pilot testing would also be able to be treated to meet the MCLs.

**Table 20. Constituents with Maximum Contaminant Levels Detected in Pilot Plant Reverse Osmosis Permeate**

| Parameter | Unit | MCL | Median[a] (Range) |
|---|---|---|---|
| ***Secondary MCLs Consumer Acceptance*** | | | |
| Chloride | mg/L | 250 | 3 (<1-6) |
| Conductivity | µS/cm | 900 | 38 (32-46) |
| Odor threshold | units | 3 | 5[b] |
| Sulfate | mg/L | 250 | <1 (<1 – 1) |
| TDS | mg/L | 500 | <10 (<10 – 26) |
| Turbidity | NTU | 5 | <0.05 (<0.05 – 0.1) |
| ***Primary MCLs Inorganics*** | | | |
| Aluminum | mg/L | 0.2 | <0.01 (<0.01 – 0.045) |
| Arsenic | mg/L | 0.01 | <0.001 (<0.001 – 0.002) |
| Chromium | mg/L | 0.05 | 0.005 |
| Cyanide | mg/L | 0.15 | <0.005 (<0.005 – 0.007) |
| Fluoride | mg/L | 2 | <0.1 (<0.1 – 0.2) |
| Selenium | mg/L | 0.05 | <0.002 (<0.002 – 0.01) |
| ***Primary MCLs Synthetic Organic Compounds*** | | | |
| Total trihalomethanes | µg/L | 80 | 1.85 (0.68 – 5) |

| Parameter | Unit | MCL | Median[a] (Range) |
|---|---|---|---|
| *Primary MCLs Radionuclides* | | | |
| Radium-226 | pCi/L | 5 | 0.298±0.327 |

a. Parameters with no range were only sampled for during one complete MCL/NL sampling event. Includes samples when the agricultural wash water was combined with raw wastewater and treated at the RTP.

b. The odor threshold test was conducted on the RO permeate without dechlorination, and the majority of odor is assumed to be a result of the chloramine residual. The chloramine residual would be reduce through the UV/peroxide AOP and further reduced as a result of chloramine decay at the injection site. In addition, UV/peroxide AOP has been shown to significantly reduce odor compounds in RO permeate (Agus et al., 2011), such that the secondary MCL for odor would be met in the purified water.

### *Constituents with Notification Levels and Advisory Action Levels*

Five constituents with NLs were detected at least once in the RO permeate as shown in **Table 21**, but only NDMA was found at concentrations above its NL. None of the constituents with AALs were detected in RO permeate.[39] For NDMA, the full-scale AWT Facility would include a UV/AOP process that would be designed to produce purified water at or below the NDMA NL. The addition of the other source waters not evaluated during pilot testing should not impact NDMA levels based on the data from the source water testing (e.g., low NDMA and low TOC levels in comparison to the agricultural wash water and municipal wastewater).

**Table 21. Constituents with Notification Levels and Archived Action Levels Detected in Reverse Osmosis Permeate**

| Constituent | Unit | NL | Median[a] (Range) |
|---|---|---|---|
| Boron | mg/L | 1 | 0.18 (0.16 – 0.23) |
| Formaldehyde | mg/L | 0.1 | 0.028 |
| NDMA | ηg/L | 10 | 27 (20 – 32) |
| N-Nitrosodi-n-propylamine (NDPA) | ηg/L | 10 | <2 (<2 – 2.9) |
| 1,4-dioxane | µg/L | 1 | <1 |

a. Parameters with no range were only sampled once during a complete MCL/NL/AAL sampling event.

### *Total Organic Carbon*

The Groundwater Replenishment Regulations require that the recycled water must meet an average TOC concentration not exceeding 0.5 mg/L. The TOC concentrations in the RO permeate are impacted by the ozone dose used in the ozone pretreatment unit process. The TOC concentrations in the RO permeate at a time when ozone dose was 10 mg/L were consistently below 0.5 mg/L, ranging from 0.27 mg/L to 0.42 mg/L, including the period when the agricultural wash water was added to the municipal wastewater for treatment at the RTP. However, when the ozone dose was increased to 20 mg/L, the TOC concentration in some of the RO permeate samples exceeded 0.5 mg/L. This information helped in the selection of the design ozone dose chosen for the full-scale AWT Facility; namely the lower dose of 10 mg/L, which, coupled with the expected reduction in TOC from blending with other low-TOC source waters and treatment through the other AWT Facility unit processes (primarily RO), would consistently produce purified water not exceeding 0.5 mg/L TOC. Thus, the TOC limit will readily be met in the purified water in compliance with the Groundwater Replenishment Regulations.

### *Total Nitrogen*

The Groundwater Replenishment Regulations require that the applied recycled water not exceed a total nitrogen concentration of 10 mg/L (before or after subsurface application). The total nitrogen concentration

[39] Dieldrin is removed by RO (99%) and would be further reduced by UV/AOP.

for all tests conducted during pilot plant testing of the ozone-MF-RO portion of AWT Facility processes found that the total nitrogen ranged from 1.5 mg/L to 2.9 mg/L, significantly lower than the 10 mg/L regulatory limit.

Although two of the source waters (Blanco Dain and Tembladero Slough) were found to have total nitrogen concentrations greater than that in the RTP secondary effluent (concentration of 44.2 mg/L), an analysis of monthly flows for the composite of all projected flows to the RTP and (after secondary treatment) to the AWT Facility predicted that the total nitrogen in the effluent from the AWT Facility pilot plant would have a maximum concentration of 3.1 mg/L. Therefore, despite the high levels of total nitrogen in some of the untreated source waters, the full-scale AWT Facility would meet the total nitrogen requirement specified in the Groundwater Replenishment Regulations.

**Lead and Copper**

As previously discussed, lead and copper were below their respective action levels in all of the source waters sampled and, thus, would not exceed their action levels in the purified water after treatment in the AWT Facility. Therefore, there was no need to sample for lead and copper in the pilot plant testing.

**Priority Pollutants**

Sixty-four priority pollutants were sampled and analyzed during the pilot plant sampling program. Of these constituents, 48 were found to be below detection limits in the RO permeate. Sixteen constituents were detected, all of which had either MCLs or NLs that are addressed elsewhere in this Section. It is noted that of the 16 priority pollutants detected, only NDMA was found above its NL. The UV/peroxide AOP process, which will follow the RO process in the full-scale AWT Facility, will be designed to reduce the NDMA concentration to below the NL of 10 ηg/L.

## 13.4. Reliability and Redundancy

The full-scale AWT Facility and recharge of the purified water would provide reliability and redundancy through the use of multiple treatment barriers for each type of constituent as shown in **Table 22**. Including the RTP in combination with the AWT Facility, the integrated treatment system would achieve chemical constituent removal redundancy by employing at least two treatment technologies for most constituent types and at least five technologies for each pathogen category, as shown in the table below.

**Table 22. Proposed Groundwater Replenishment Project Treatment Barriers**

| Process | Chemical Constituents | | | | | Pathogenic Microorganisms | | |
|---|---|---|---|---|---|---|---|---|
| | Nitrogen | TOC | DPBs | Inorganics | CECs | Bacteria | Viruses | Protozoa |
| Primary/ Secondary | ✓ | ✓ | | ✓ | ✓ | ✓ | ✓ | ✓ |
| Ozone | | | ✓ | | ✓ | ✓ | ✓ | ✓ |
| MF | | ✓ | | ✓ | | ✓ | | ✓ |
| RO | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| UV/$H_2O_2$ | | | ✓ | | ✓ | ✓ | ✓ | ✓ |
| Aquifer | | | | | | ✓ | ✓ | ✓ |

## 13.5. Basin Plan Compliance

For the Seaside Basin, the Basin Plan includes general narrative groundwater objectives for taste and odor and radioactivity, and numeric objectives based on primary and secondary MCLs. As previously discussed, the RO permeate followed by AOP would meet all MCLs, including those that would satisfy the narrative objectives. Based on the results of the source water testing (e.g., the types of constituents detected above the MCLs) and pilot performance for these constituents, the inclusion of the additional source waters not used/treated by the pilot testing would also be able to be treated to meet the MCLs.

The Basin Plan also includes guidelines to protect soil productivity, irrigation, and livestock watering. The guidelines are shown in **Table 23** along with the highest detected concentrations in the untreated source waters. With regard to salinity and chloride, the RO permeate concentrations were below the guidelines. One of the Basin Plan guidelines is the Sodium Adsorption Ration (SAR), which is used to determine if irrigation water affects the rate of water infiltration. It is not a constituent, but a calculated value based on the square root of the ratio of sodium to calcium plus magnesium. The cations (calcium, magnesium, and sodium) used to derive an SAR would be removed by RO as part of the full-scale AWT Facility. As discussed earlier in this Section, even including all of the source waters, the predicted total nitrogen concentration after secondary treatment at the RTP and treatment through the full-scale AWT Facility would result in maximum purified water concentration of 3.1 mg/L, which is below the individual guidelines for ammonia and nitrate. The chemical stabilization process following AOP in the full-scale AWT Facility will influence bicarbonate and pH concentrations in the purified water. These concentrations will be within the Basin Plan Guidelines as demonstrated by existing groundwater replenishment projects elsewhere.

**Table 23. Basin Plan Guidelines for Interpretation of Water Quality for Irrigation**

| Source Water | Constituent | Guideline[a] | Highest Concentration Detected in Untreated Water | Median/Range in RO Permeate |
|---|---|---|---|---|
| RTP Effluent | Salinity (EC)[b] | 750 µS/cm | 1623 µS/cm | 38 (32-46) |
| | Permeability (EC) | >500 µS/cm | 1623 µS/cm | 38 (32-46) |
| | Permeability SAR (unit less) | <6.0 (adjusted)[c] | 6.4[d](not adjusted) | 1.6[e](not adjusted) |
| | Chloride (foliar absorption, e.g., sprinklers) | < 106 mg/L | 235 | 6 mg/L |
| | Ammonia-N | < 5 mg/L | 39.7 mg/L | --- |
| | Nitrate-N | < 5 mg/L | 42 mg/L | 0.7 mg/L |
| | Bicarbonate | < 90 mg/L | 420 mg/L | --- |
| | pH | Normal range | 8 | --- |
| Agricultural Wash Water | Salinity (EC) | 750 µS/cm | 1830 µS/cm | --- |
| | Permeability (EC) | >500 µS/cm | 1830 µS/cm | |
| | Permeability SAR (unit less) | <6.0 (adjusted) | 4.3 (not adjusted) | |
| | Chloride (foliar absorption, e.g., sprinklers) | < 106 mg/L | 292 mg/L | |
| | Ammonia-N | < 5 mg/L | 7.5 mg/L | |
| | Nitrate-N | < 5 mg/L | 1.5 mg/L | |
| | Bicarbonate | < 90 mg/L | 310 mg/L | |
| | pH | Normal range | 7.3 | |
| Blanco Drain | Salinity (EC) | 750 µS/cm | 2929 µS/cm | --- |
| | Permeability (EC) | >500 µS/cm | 2929 µS/cm | |
| | Permeability SAR, unit less | <6.0 (adjusted) | 3.4 (not adjusted) | |
| | Chloride (foliar absorption, e.g., sprinklers) | < 106 mg/L | 307 mg/L | |

| Source Water | Constituent | Guideline[a] | Highest Concentration Detected in Untreated Water | Median/Range in RO Permeate |
|---|---|---|---|---|
| | Ammonia-N | < 5 mg/L | < 0.5 mg/L | |
| | Nitrate-N | < 5 mg/L | 352 mg/L | |
| | Bicarbonate | < 90 mg/L | 455 mg/L | |
| | pH | Normal range | 8.6 | |
| Lake El Estero | Salinity (EC) | 750 µS/cm | 2559 µS/cm | |
| | Permeability (EC) | >500 µS/cm | 2559 µS/cm | |
| | Permeability SAR, unit less | <6.0 (adjusted) | 5.6 (not adjusted) | |
| | Chloride (foliar absorption, e.g., sprinklers) | < 106 mg/L | 514 mg/L | --- |
| | Ammonia-N | < 5 mg/L | < 0.05 mg/L | |
| | Nitrate-N | < 5 mg/L | < 0.1 mg/L | |
| | Bicarbonate | < 90 mg/L | 259 mg/L | |
| | pH | Normal range | 8.3 | |
| Tembladero Slough | Salinity (EC) | 750 µS/cm | 2939 µS/cm | |
| | Permeability (EC) | >500 µS/cm | 2939 µS/cm | |
| | Permeability SAR, unit less | <6.0 (adjusted) | 4.4 (not adjusted) | |
| | Chloride (foliar absorption, e.g., sprinklers) | < 106 mg/L | 394 mg/L | --- |
| | Ammonia-N | < 5 mg/L | < 0.5 | |
| | Nitrate-N | < 5 mg/L | 0.5 mg/L | |
| | Bicarbonate | < 90 mg/L | 443 mg/L | |
| | pH | Normal range | 8 | |

a. No problems expected at these levels with interpretation based on possible effects on crops and/or soils. Guidelines are flexible and should be modified when warranted by local experience or special conditions of crops, soils, and method of irrigation.
b. Electrical Conductivity (EC).
c. Adjusted mathematically to account for calcium precipitation. Because the non-adjusted SAR values for the source waters and RO permeate are slightly higher or substantively less than the guideline, it was not necessary to convert the SAR values to adjusted SARs.
d. Based on RTP secondary effluent.
e. Based on a stabilized RO permeate sample from the pilot testing.

Finally, the Basin Plan includes water quality objectives for agricultural use for irrigation supply and livestock watering as shown in **Table 24**. Of the 21 constituents with objectives, 14 have MCLs (aluminum, arsenic, beryllium, cadmium, chromium, fluoride, iron, manganese, mercury, nickel, nitrate+nitrite, nitrite, selenium, and zinc). All of the agricultural objectives are set at higher concentrations than the MCLs with the exception of the three constituents shown in Table 24, along with the RO permeate results from the pilot testing. Thus, the RO permeate for these MCL-based constituents either meets MCLs or meets the less stringent Basin Plan agricultural objectives.

**Table 24. Constituents with Maximum Contaminant Levels Less Stringent than Basin Plan Agricultural Objectives and Pilot Plan Reverse Osmosis Permeate Results**

| Parameter | Agricultural Objective[a] | MCL | Piloting RO Permeate Concentration Median (Range) |
|---|---|---|---|
| ***Secondary MCLs Consumer Acceptance*** | | | |
| Zinc, mg/L | 5 | 5 | ND[b] |
| ***Primary MCLs Inorganics*** | | | |
| Fluoride, mg/L | 1 | 2 | <0.1 (<0.1 – 0.2) |
| Selenium, mg/L | 0.02 | 0.05 | <0.002 (<0.002 – 0.01) |

a. Maximum values – considered as 90th percentile values not to be exceeded.
b. ND – not detected.

The Basin Plan also incudes agricultural objectives for copper and lead. In the case of copper, the objectives for irrigation supply (0.2 mg/L) and livestock watering (0.5 mg/L) are more stringent than the drinking water action level (1.3 mg/L). The maximum concentrations of copper measured in any of the untreated source waters was 0.073 mg/L, which is below the agricultural objectives prior to advanced treatment. For lead, the Basin Plan objectives for irrigation supply (5.0 mg/L) and livestock watering (0.1 mg/L) are less stringent than the drinking water action level (0.015 mg/L). The maximum concentration of lead measured in any of the untreated source waters was 0.0018 mg/L, which is well below the agricultural objectives prior to advanced treatment. Thus, the source water sampling program found that lead and copper were below their respective agricultural basin plan objectives in all of the untreated source waters sampled.

The Basin Plan includes agricultural objectives for two constituents with NLs: boron and vanadium. In the case of boron, the agricultural objective for irrigation supply (0.75 mg/L) is more stringent than the NL of 1 mg/L. Vanadium was not detected in the RO permeate from the pilot testing. The median boron concentration in the RO permeate was 0.18 mg/L (range 0.16 to 0.23 mg/L). Thus, the piloting testing found that boron and vanadium were below their respective agricultural basin plan objectives in RO permeate.

The three remaining agricultural objectives do not have regulatory standards or goals: cobalt, lithium, and molybdenum. Studies of RO treatment have shown that it is effective in removing metals such as these from secondary wastewater. Cobalt and molybdenum were removed to below detection levels, and lithium was removed by 68% with a median concentration of 0.01 mg/L, which is below agricultural objectives for irrigation supply ranging from 0.075 to 2.5 mg/L (Department of Health, Western Australia, 2009).

Based on the source water sampling, piloting testing results, and pertinent research, the purified water that would be produced by the RTP and full-scale AWT Facility would meet Basin Plan guidelines for irrigation and the objectives for agricultural reuse.

## 14. Summary of Hydrogeologic and Geochemical Modeling

The GWR Project purified water would be injected within a portion of the Seaside Subbasin of the Salinas Valley Groundwater Basin, which is an adjudicated basin with an established perennial natural safe yield of between 2,581 AFY to 2,913 AFY. Groundwater pumping in the Seaside Groundwater Basin provides water supply for municipal, irrigation (primarily golf courses), and industrial uses. Prior to basin adjudication in 2006, pumping exceeded the perennial natural safe yield and contributed to significant basin-wide water level declines. Over-pumping in the coastal subareas resulted in water levels declining below sea level at the coast, placing aquifers at risk of seawater intrusion. Since 2008, groundwater pumping has declined in accordance with the judgment. In addition, the Monterey Peninsula Aquifer Storage and Recovery Project (ASR Project) has provided about 1,500 to 1,800 AF of treated Carmel River Basin groundwater for injection and recovery into the basin.[40] The ASR project is located downgradient and within about 1,000 feet from the GWR Project injection well facilities.

Purified water would be recharged into the Seaside Basin's two primary aquifers used for water supply - the Paso Robles Aquifer and the underlying Santa Margarita Aquifer. Recharge would be accomplished through relatively shallow vadose zone wells (Paso Robles Aquifer) and deep injection wells (Santa Margarita Aquifer).

In support of the GWR Project EIR, Todd Groundwater prepared two technical reports that addressed potential recharge impacts and field investigations. The Recharge Impacts Assessment Report analyzed the recharge components of the project, including recharge wells, operational facilities, and the fate and transport of the purified water in the groundwater basin (Todd Groundwater, 2015a). The Field Investigation Report included geochemical modeling to test stabilized RO permeate compatibility with ambient groundwater (Todd Groundwater, 2015b).

### 14.1. Compliance with Underground Retention Time Requirements

The Groundwater Replenishment Regulations establish specific requirements for underground retention time of recycled water:

- The Response Retention Time (RRT) that requires recycled water to be retained underground for a sufficient period of time (as proposed by a project sponsor) to identify and respond to any treatment failure so that inadequately treated recycled water does not enter a potable water system. The RRT has to be at least two months.
- To meet the 12-log virus reduction requirement, projects can be credited with a 1-log virus reduction per month up to 6 months (i.e., 6-logs).

Notwithstanding the effectiveness of the RTP[41] and AWT Facility in controlling pathogens, the GWR Project also would include up to a 6-log virus reduction credit by keeping the purified water underground for six months prior to arrival at the closest downgradient production wells. The RRT for the GWR Project is expected to be 5 to 6 months, similar to the RRT approved by DDW for the Alamitos Barrier Groundwater Replenishment Project. The underground retention time would be demonstrated through a field tracer test within the first three months of operation in compliance with the Groundwater Replenishment Regulations.

For the purposes of planning projects, the Groundwater Replenishment Regulations allow for use of models with safety factors to estimate retention times. For the GWR Project, the Watermaster groundwater model was used to demonstrate underground retention time. When this type of model is used to demonstrate travel time, the required retention time is doubled to account for uncertainty in the method of analysis as required by the Groundwater Replenishment Regulations. Therefore, the model would need to demonstrate a travel time of one year to allow for a six-month planning credit. Preliminary modeling for the GWR Project indicated that seven of the eight GWR Project wells would meet the one-year requirement. However, modeling indicated that purified water injected at one injection well would reach a drinking water well in 327 days under certain pumping conditions. This travel time is 38 days short of the model-based one-year travel time requirement.

While the required underground retention time of six months remains applicable to the GWR Project, demonstration of compliance would need to be made with the tracer test rather than modeling alone. Until that test can occur, it is assumed for planning purposes that the estimated minimum of approximately 11 months travel time will limit the virus reduction credit to a 5.0-log credit for the GWR Project. Based on the proposed AWT Facility virus reduction credits (12-logs) and the 5.0-log retention time credits, the GWR Project would exceed the 12-log virus reduction requirements in the Groundwater Replenishment Regulations.

---

[40] Currently, Carmel River Basin water (extracted from riverbank wells) is treated to drinking water standards and conveyed to the ASR wells for recharge when excess water is available.

[41] The GWR Project is not taking credit for removal of pathogens through primary and secondary treatment.

## 14.2. Compliance with Anti-degradation and Recycled Water Policies

### *Assessment of Impact of GWR Project on Contaminant Plumes*

The Recycled Water Policy does not limit the authority of a RWQCB to impose additional requirements for a proposed groundwater replenishment project that has a substantial adverse effect on the fate and transport of a contaminant plume. Thus, a study was performed to evaluate the potential impacts of the GWR Project in areas of contamination in the Seaside Basin (Todd Groundwater, 2015a).

The GWR Project injection well facilities would be located on a portion of the former Fort Ord military base (referred to as Site 39), which provided training and staging for U.S. troops from 1917 to 1994. Site 39 contained at least 28 firing ranges that were used for small arms and high explosive ordnance training using rockets, artillery, mortars and grenades. Considerable expended and unexploded ordnance have been documented in various areas of Site 39. Beginning in 1984, numerous environmental investigation and remediation activities have occurred on Site 39. During these investigations, metals and various compounds associated with explosives have been detected in soil. Remediation, including removal of munitions and explosives, has been more extensive in areas targeted for redevelopment, an area that includes the GWR Project injection well facilities site (Todd Groundwater, 2015a). Groundwater analyses do not indicate that former Fort Ord activities have impacted groundwater in the existing wells near the GWR Project injection site (Todd Groundwater, 2015a).

No documented groundwater contamination or contaminant plumes have been identified in the GWR Project injection well facilities area. Therefore, injection associated with the GWR Project would not exacerbate existing groundwater contamination or cause plumes of contaminants to migrate. As a result, additional RWQCB requirements related to groundwater contaminants would not be necessary for the GWR Project.

### *Assessment of Impact of GWR Project on Dissolution of Natural or Anthropogenic Constituents*

The Recycled Water Policy does not limit the authority of a RWQCB to impose additional requirements for a proposed groundwater replenishment project that causes constituents, such as naturally occurring arsenic, to become mobile and impact groundwater quality.

When two water types with different water chemistry are mixed (such as the GWR Project purified water and groundwater), geochemical reactions could occur in the groundwater system. These reactions could potentially result in leaching of natural or anthropogenic constituents, which could potentially impact groundwater quality. The risk of geochemical impacts from incompatibility would be addressed at the proposed AWT Facility by including a stabilization process to ensure that purified water is stabilized and non-corrosive.

Laboratory leaching tests were conducted using the stabilized RO pilot water[42], with the results used to conduct a detailed geochemical modeling analysis that will be used to inform the design of the AWT Facility stabilization system (Todd Groundwater, 2015b). The geochemical modeling assessment is summarized in a field investigation report. Based on modeling results, potential changes in groundwater concentrations as a result of the GWR Project are expected to be minor and would not result in exceedances of groundwater quality standards (Todd Groundwater, 2015b).

### *Salt/Nutrient Management Plan*

A SNMP has been prepared for the Seaside Basin to comply with the Recycled Water Policy (HydroMetrics, 2014). The SNMP was developed with basin stakeholder input through the Seaside Basin Watermaster and has been adopted by the Water Management District. The SNMP has been submitted to the Central Coast Region RWQCB for consideration as a Basin Plan amendment.

[42] The samples were RO permeate collected from the MRWPCA pilot plant. The RO permeate was stabilized using a bench-scale post-treatment stabilization unit to better approximate the water quality anticipated for the proposed AWT Facility.

As documented in the SNMP, ambient groundwater generally exceeds the TDS Basin Plan groundwater objective in many areas of the Seaside Basin, while nitrate and chloride concentrations generally meet Basin Plan objectives (Todd Groundwater, 2015a). A study that evaluated the water quality of the stabilized RO pilot water found that the concentrations of TDS, nitrate, and chloride in the purified water meet all Basin Plan objectives (Todd Groundwater, 2015a). Further, these concentrations are generally lower than average concentrations in groundwater. As such, replenishment of the Seaside Basin using the GWR Project purified water would not adversely impact salt and nutrient loading in the basin and would provide benefits to local groundwater quality

***Anti-degradation***

Per the results of the SNMP, the GWR Project would not degrade groundwater or utilize assimilative capacity above the 10% threshold cited in the Recycled Water Policy that requires a more detailed anti-degradation analysis. As described in previous sections of this report, the GWR Project purified water would be treated and stabilized to meet all drinking water quality objectives and other Basin Plan objectives. Further, the GWR Project purified water would be expected to be higher quality water than ambient groundwater with respect to TDS, chloride, and nitrate. As such, the GWR Project will neither cause a violation of a groundwater quality standard nor adversely impact beneficial uses. Rather, the GWR Project purified water would have a beneficial effect on local groundwater quality.

### 14.3. Studies of Groundwater Levels and Storage

Because the GWR Project provides additional water for downgradient groundwater extraction, it results in both higher and lower water levels in existing basin wells over time depending on the timing of extraction and the buildup of storage in the basin. Hydrometrics (2015) examined changes in water levels for eight key production wells for a 33-year simulation period (including 25 years of the GWR Project operation). The results showed that the water levels would be sometimes lower because of increased pumping at existing extraction wells. However, water levels would be lowered only about 10 feet or less and would be lowered for a relatively short duration, typically for a few months. In addition, water levels would be generally higher than pre-GWR Project levels. As such, none of the municipal or private production wells would experience a reduction in well yield or physical damage. All existing wells would be capable of pumping the current level of production or up to the permitted production rights (Todd, Groundwater, 2015a).

The analysis of the closest shallow coastal well indicated that increased pumping of the GWR Project water would not result in water levels falling below elevations protective of seawater intrusion (Hydrometrics, 2015). Although it would take time for the beneficial impacts of recharge to reach coastal pumping wells, the increased pumping of nearby production wells would only reduce water levels about two feet near the coast. The analysis showed that for the duration of the model simulation period, the closest coastal well would remain above protective elevations for seawater intrusion.

In addition, Todd Groundwater (2015a) found that there would be no adverse impacts to the quantity of groundwater resources. Because the GWR Project would only recover the amount of purified water injected, there would be no long-term change in groundwater storage because the purified water being injected would eventually be extracted for municipal use.

## 15. Constituents of Emerging Concern – Source Waters and Pilot Testing Results

Constituents of emerging concern were evaluated using the Eurofins Eaton Analytical Liquid Chromatography Tandem Mass Spectrometry method that specifically addresses 92 constituents. For the source waters, samples were collected quarterly for one year from the RTP effluent, agricultural wash water, and Blanco Drain, and once from in the Lake El Estero and Tembladero Slough waters. The highest occurrence of CECs was in the RTP secondary effluent. This was expected, as these compounds are common in wastewater and are often not significantly removed by conventional primary and secondary wastewater treatment (see **Figure 4**). For the 92 CECs that were included in the Eurofins method, 59 were detected in at least one source water, with the maximum concentrations being observed in the RTP secondary effluent for 50 of the 59 constituents. Of the nine other constituents, five were seen at the highest concentration in the agricultural wash water, and the other four maximum concentrations were detected in the drainage waters. It should be noted that for the new source waters, the concentrations presented in Figure 4 are raw water concentrations that do not take into account blending with the other waters and treatment reduction through the RTP primary and secondary treatment processes, nor treatment through the pilot test facility or full scale AWT Facility.

The pilot testing was conducted using both the existing RTP secondary effluent and a combination of RTP secondary effluent and the agricultural washwater, which captured the waters with the overall highest levels of CECs. Samples were collected in the pilot influent, ozone effluent, and RO permeate. Ozonation consistently reduced the concentrations of many of the CECs to levels below detection. On average, there were approximately 40 CECs detected in the pilot influent and 26 detected in the ozone effluent. With a few exceptions described below, the RO system removed the remaining CECs to below levels of detection. In addition, the full-scale AWT Facility would include AOP, which would create an additional barrier to destroy CECs. The CECs removals observed across the pilot system are shown in **Figure 5** (Trussell Technologies, 2014).

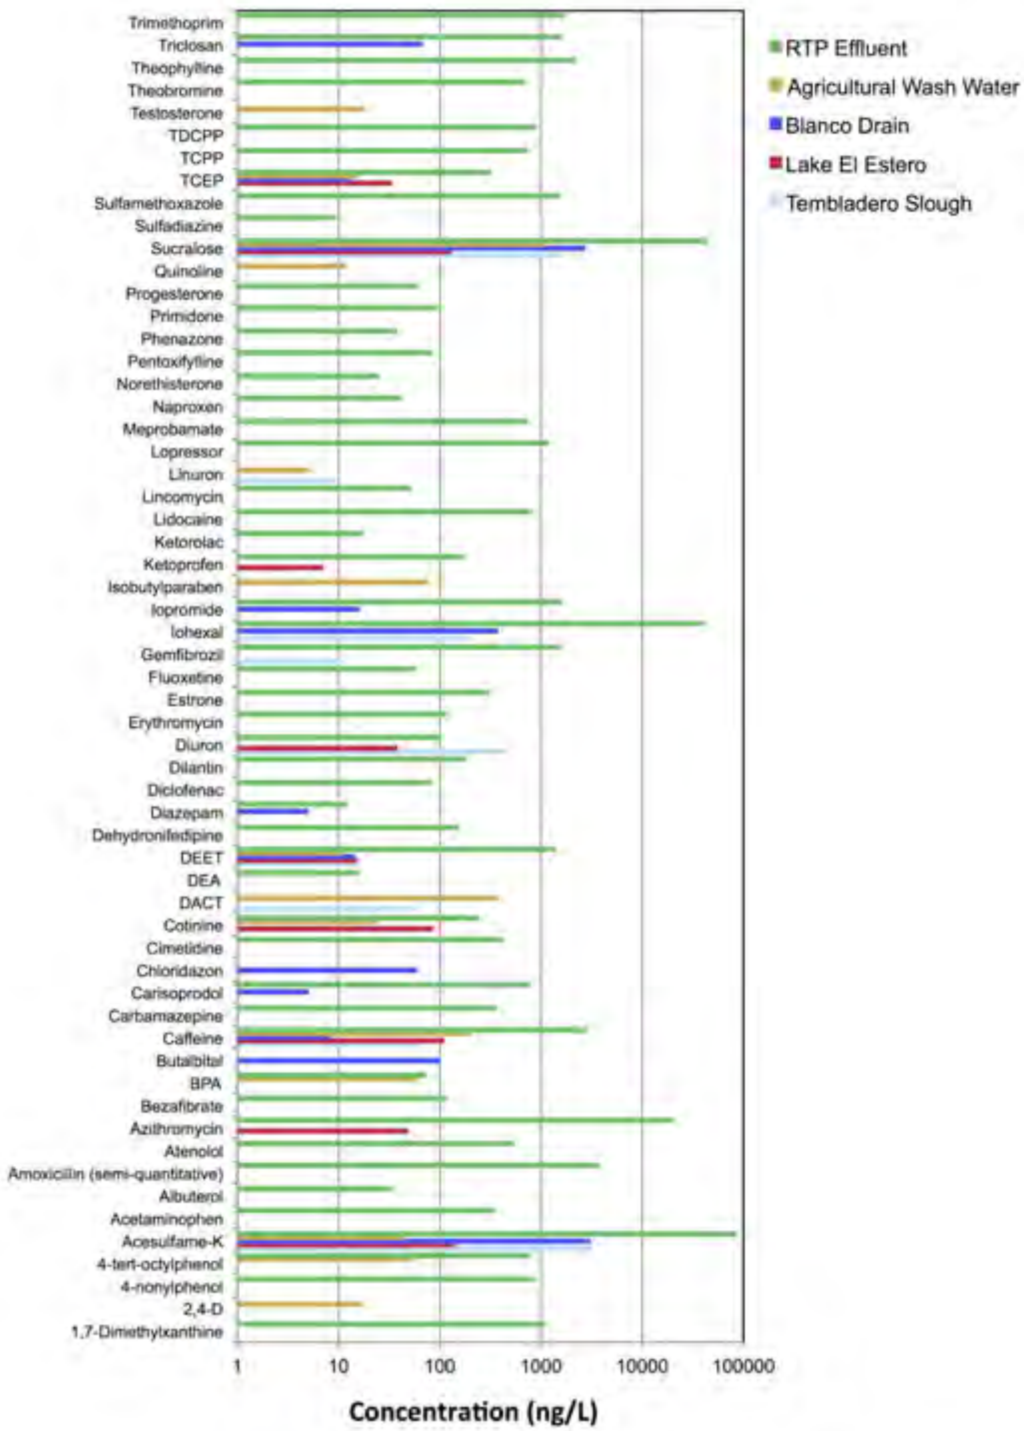

**Figure 4. Constituents of Emerging Concern – Maximum Values Detected in the Various Proposed Project Source Waters**

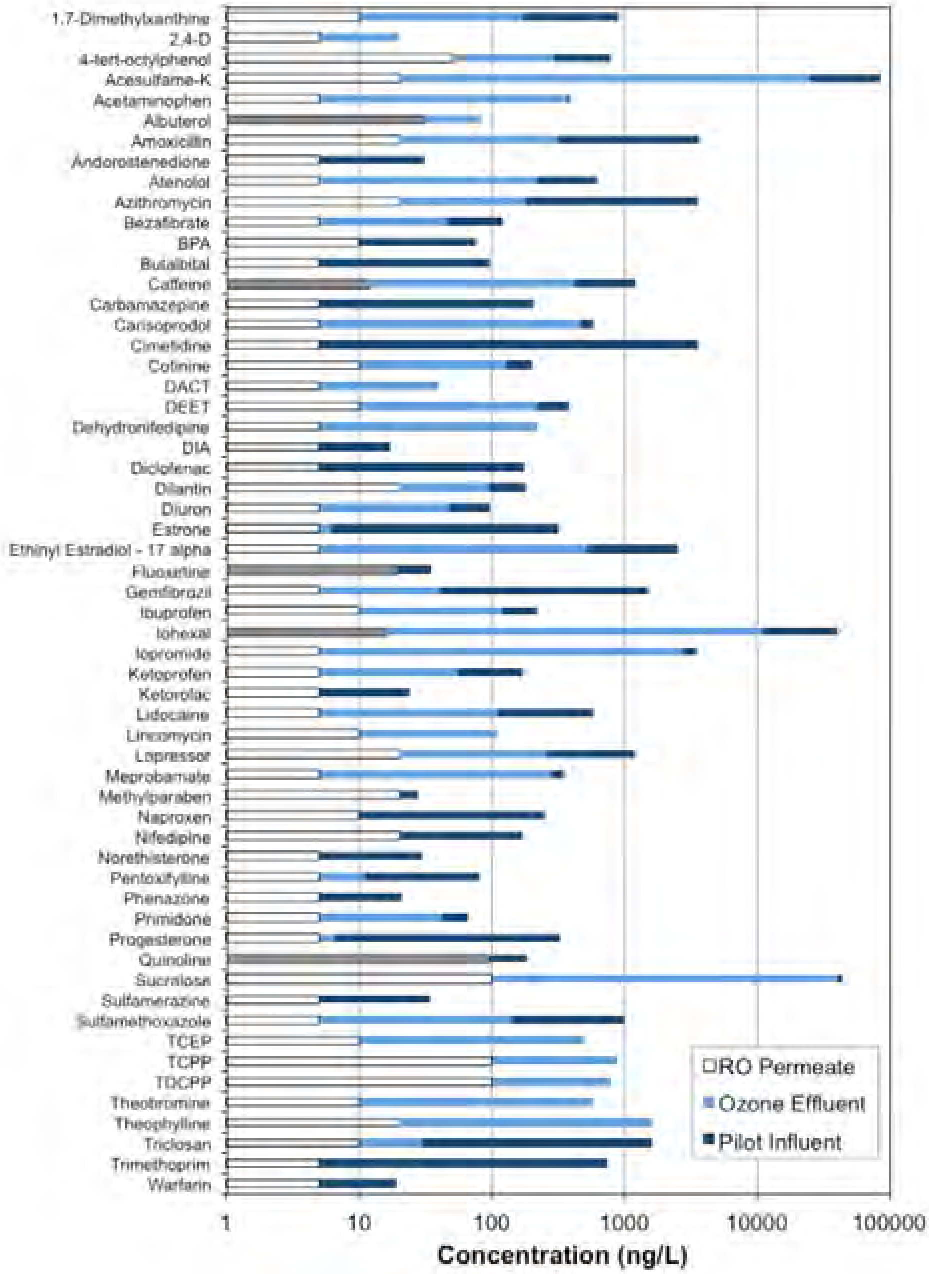

**Figure 5. Constituents of Emerging Concern - Removal During Pilot Testing (Maximum Values Observed)**[43]

In three of the seven monthly sampling events, there were a few CECs detected in the RO permeate (not including previously discussed NDMA). These compounds were erythromycin, caffeine, iohexal, albuterol, carbadox, fluoxetine, and quinolone. In all cases, these constituents were detected in only one sample, and it is likely that several of the detections were actually false laboratory positives due to sample or laboratory contamination. Specifically, erythromycin and carbadox (both antibiotics) were not detected in either the pilot influent or the ozone effluent, and thus the RO permeate detection from these compounds

---

[43] For the RO permeate, white (open) boxes indicate that the constituent was not detected and the reported value is the detection limit, while gray boxes indicate the constituent was detected. No ozone effluent value is shown for cases where the constituent was below detection in the ozone effluent. In addition, in cases where there was no reduction through the ozone system (i.e., the pilot influent was equal to or less than the ozone effluent), only the ozone effluent concentration is shown.

was excluded from the analysis. For quinoline (a chemical found in cigarettes and automobile exhaust) and fluoxetine (an antidepressant), the RO permeate values exceeded the ozone effluent value, and it is strongly suspected that these results are false positives as well. The remaining compounds detected in the RO permeate were caffeine (a simulant), iohexal (a contrast agent), and albuterol (an asthma medication). They were detected at concentrations near the detection limit and it is unclear whether or not they are actual values. For all of these constituents, it is important to keep in mind that (1) the concentrations detected were many orders of magnitude below any demonstrated health related levels as shown in **Table 25**, and (2) these compounds have all been shown to be effectively removed (up to 90%) by UV/peroxide AOP that will be part of the full-scale AWT Facility. With this additional treatment barrier, it is expected that all of these CECs would be below current detection levels in the purified water.

**Table 25. Comparison of Detected Constituents of Emerging Concern in Reverse Osmosis Permeate to Drinking Water Equivalent Levels**

| Constituent | Classification | Maximum Observed Concentration in RO Permeate (ηg/L) | DWEL (ηg/L) |
|---|---|---|---|
| Caffeine | Stimulant | 10 | 87,000,000[a] |
| Iohexal | Contrast agent | 10 | 725,000[b] |
| Albuterol | Asthma medication | 50 | 41,000[c] |

## 16. Environmental Impact Report Groundwater Resources Significance Determination

Based on the source water sampling, results of the pilot testing and hydrogeologic studies, other relevant research, and information from other groundwater replenishment projects, the following conclusions are offered with regard to the groundwater resources significance determination:

- The GWR Project purified water would meet groundwater quality standards in the Basin Plan and drinking water quality standards. Further, the treatment processes that would be incorporated into the AWTF would be selected and operated to ensure that all water quality standards would be met by the purified water and in groundwater. A monitoring program would document project performance.
- The GWR Project purified water would exhibit much lower concentrations of TDS and chloride than ambient groundwater and would be expected to provide a localized benefit to groundwater quality.
- No documented groundwater contamination or contaminant plumes have been identified in the GWR Project area. Therefore, injection associated with the GWR Project would not exacerbate existing groundwater contamination or cause plumes of contaminants to migrate.
- Injection of AWT Facility purified water would not degrade groundwater quality.
- The GWR Project purified water would be stabilized as part of the AWT Facility to ensure no adverse geochemical impacts. Geochemical modeling indicates that the potential for impacts to groundwater quality from leaching is low and that the GWR Project will not cause exceedances of water quality standards. Further, modeling results will be used to inform AWTF stabilization procedures, which can be adjusted as needed.
- The GWR Project would result in both higher and lower water levels in wells throughout the Seaside Basin at various times. Although water levels would be slightly lower during some time periods, the difference would generally be small and judged insignificant. Modeling indicates that the GWR Project would not lower water levels below protective levels in coastal wells and would not exacerbate seawater intrusion (Todd Groundwater, 2015a).

## 17. Summary of the Groundwater Replenishment Project Compliance Regulation and Policies

**Table 25** presents a summary of how the GWR Project would comply with applicable regulations and policies for the use of recycled water for groundwater replenishment.

**Table 26. Proposed Groundwater Replenishment Project Compliance Summary**

| | Requirements | Proposed Compliance Description |
|---|---|---|
| ***Groundwater Replenishment Regulations*** | | |
| Source Control | Entities that supply recycled water to a groundwater replenishment project must administer a comprehensive source control program that includes: (1) an assessment of the fate of Division of Drinking Water (DDW) and Regional Water Quality Control Board (RWQCB)-specified contaminants through the wastewater and recycled water treatment systems; (2) provisions for contaminant source investigations and contaminant monitoring that focus on DDW and RWQCB-specified contaminants; (3) an outreach program to industrial, commercial, and residential communities; and (4) an up-to-date inventory of contaminants. | Monterey Regional Water Pollution Control Agency (MRWPCA) administers an approved pretreatment program under National Pollutant Discharge Elimination System (NPDES) Permit R3-2008-0008. These activities are conducted in accordance with MRWPCA Ordinance No. 2008-01[44] and federal pretreatment regulations pursuant to 40 Code of Federal Regulations Part 403 (40 CFR 403) and Sections 307 and 402 of the Clean Water Act (CWA). The MRWPCA source control program would meet the requirements as follows:<br>– Contaminant Assessment. The GWR Project's pilot testing evaluated the fate of chemicals and contaminants through the Regional Treatment Plant (RTP) and treatment systems for the Advanced Water Treatment (AWT) Facility. This list of chemicals and contaminants being evaluated included priority pollutants, constituents with maximum contaminant levels (MCLs) and notification levels (NLs), and constituents of emerging concern (CECs), and pesticides of local interest. Future studies would be conducted at the request of DDW and RWQCB or based on monitoring data collected by MRWPCA.<br>– Contaminant Source Investigation. MRWPCA would conduct investigations and monitoring as requested by DDW and RWQCB or based on monitoring data collected by MRWPCA.<br>– Outreach: MRWPCA currently administers an effective outreach program that consists of RTP facility tours, classroom presentations, information on the GWR Project, information on pharmacies offering drug take-back programs, participation/exhibits in community events, school outreach (presentations, materials, teacher curriculum training and workshops), RTP tours, commercials and advertising for controlling fats, oil and grease, and participation in the Monterey County Oil Recycling Program. The program would be modified pending implementation of the GWR Project.<br>– Contaminant Inventory. MRWPCA's source control program tracks and identifies industrial users and discharges, including contaminants discharged through industrial monitoring. MRWPCA maintains its industrial inventory by reviewing the phone book and online telephone |

[44] An *Ordinance Establishing Regulations for the Interception, Treatment and Disposal of Sewage and Wastewater; Providing for and Requiring Charges and Fees Therefore; and Fixing Penalties for Violation of Said Regulations*.

| | Requirements | Proposed Compliance Description |
|---|---|---|
| | | information sites, referrals from the MRWPCA Customer Service Department for new or expanded sewer connections, building permit sign-offs from all member entity building inspection departments, and service area canvassing. The inventory would also address the new source waters based on the results of the source water monitoring and subsequent monitoring when the source waters and any related industrial contributors are delivered to the RTP.<br>– Annual Reporting. MRWPCA currently prepares an annual report on the pretreatment program. Future reports would address compliance with the source control provisions pending implementation of the GWR Project. |
| Pathogen Control | Groundwater replenishment projects must achieve a 12-log enteric virus reduction, a 10-log *Giardia* cyst reduction, and a 10-log *Cryptosporidium* oocyst reduction using at least 3 treatment barriers that each achieve at least 1.0-log reduction. No treatment process can be credited with more than 6-logs reduction. The log reductions must be verified using a monitoring procedure approved by DDW. Failure to meet the specified reductions requires notification to DDW and RWQB, investigation, and/or discontinuation of recycled water use until a problem is corrected. | The GWR Project will meet the pathogen log reduction requirements by using the combination of treatment afforded by: (1) the RTP primary and secondary unit treatment processes (no credit is being sought for the reductions through these treatment processes); (2) the AWT Facility, which includes ozonation, membrane filtration (MF), reverse osmosis (RO), and advanced oxidation (AOP) using ultraviolet light (UV) and hydrogen peroxide; and; (3) six-month residence time underground prior to withdrawal at any potable water supply well (as validated by a tracer study). The tracer study, which would be approved by DDW, would start after the first 3 months of operation. MRWPCA will ensure achievement of the pathogen reductions by monitoring the RTP and AWT Facility treatment system performance using operational parameters and surrogates per DDW requirements. |
| Nitrogen Control | The concentration of total nitrogen in recycled water must meet 10 milligrams per liter (mg/L) before or after subsurface application. Failure to meet this value requires follow-up sampling, notification to DDW and RWQCB, and/or discontinuation of recycled water use until a problem is corrected. | The GWR Project will meet the 10 mg/L total nitrogen limit in the AWT Facility purified water. The RO membrane treatment system will be the key process to remove nitrogen. The predicted total nitrogen concentration in the purified water produced by the AWT Facility would achieve an expected maximum total nitrogen concentration of 3.1 mg/L including all source waters, based on the piloting and source water monitoring. MRWPCA will determine compliance with the with the 10 mg/L limit by monitoring RO performance using operational parameters and by monitoring the quality of AWT Facility purified water. |
| Regulated Chemicals Control | The recycled water must meet primary and secondary drinking water maximum contaminant levels (MCLs). Failure to meet MCLs requires follow-up sampling, notification to DDW and RWQCB, and/or discontinuation of recycled water use until the problem is corrected. | The GWR Project will meet MCLs in the AWT Facility purified water. The results of the pilot testing based on the ozone-MF-RO portion of the AWT Facility and the expected benefits of full-scale treatment with AOP show that the water treated by RO and AOP would comply with all MCLs. Based on the results of the source water testing (e.g., the types of constituents detected above the MCLs) and pilot performance for these constituents, the inclusion of the additional source waters not used/treated by the pilot testing would also be able to be treated to meet the MCLs. MRWPCA will determine compliance with MCLs by monitoring treatment performance and the quality of the AWT Facility |

| | Requirements | Proposed Compliance Description |
|---|---|---|
| | | purified water. |
| Notification Levels (NLs) | The recycled water is monitored quarterly for NLs with accelerated monitoring if the result is greater than the NL; if the running 4-week average is greater than the NL for 16 consecutive weeks, the project sponsor must notify DDW and RWQCB. | Based on the results of the pilot testing and the inclusion of the AOP system, the full-scale AWT Facility will produce purified water below NLs, including the additional source waters to be treated. |
| Unregulated Chemicals Control | Control of unregulated chemicals for all groundwater replenishment projects using 100% AWT recycled water is accomplished through limits for total organic carbon (TOC) and performance of treatment for constituents of emerging concern (CECs). TOC is used as a surrogate for unregulated and unknown organic chemicals. For subsurface application projects, the entire recycled water flow must be treated using RO and AOP. After treatment, the TOC cannot exceed an average of 0.5 mg/L. Specific performance criteria for RO and AOP processes have been included in the Groundwater Replenishment Regulations. Failure to meet the requirements established for a groundwater replenishment project results in notifications to DDW and RWQCB, response actions, and in some cases cessation of the use of recycled water. | The GWR Project will address unregulated constituents by meeting TOC limits in the AWT Facility purified water and the AWT treatment performance criteria for RO and AOP. MRWPCA will monitor unregulated chemicals and surrogates specified by DDW after AOP and in the AWT Facility purified water. |
| Response Retention Time (RRT) | The intent of the RRT is to provide time to retain recycled water underground to identify any treatment failure so that inadequately treated recycled water does not enter a potable water system. Sufficient time must elapse to allow for: a response that will protect the public from exposure to inadequately treated water; and provide an alternative source of water or remedial treatment at the wellhead if necessary. The RRT is the aggregate period of time between: identifying that the recycled water is out of compliance, treatment verification samples or measurements; time to make the measurement or analyze the sample; time to evaluate the results; time to make a decision regarding the appropriate response; time to activate the response; and time for the response to become effective. The minimum RRT is 2 months, but must be justified by the groundwater replenishment project sponsor. | MRWPCA will develop a RRT taking into consideration the following safety features that are part of the GWR Project: (1) continuous online monitoring of RO treatment with real-time results reviewed by the AWT Facility operators; (2) multiple levels of critical control points for RTP and AWT Facility operations, alarms, and unit process redundancy; and (3) the ability to shut down the AWT Facility at a moment's notice. As part of the RRT development, MWRPCA will also consider the time necessary to provide an alternative water supply should DDW determine that the GWR Project has impacted a drinking water well so that it can no longer be used as a drinking water supply. The RRT would be validated by a tracer study approved by DDW. |
| Monitoring Program | Comprehensive monitoring programs are established for recycled water and groundwater for regulated and unregulated constituents. | MRWPCA will develop a monitoring program that satisfies DDW and RWQCB requirements for the RTP, AWT Facility, and groundwater for nitrogen, TOC, and regulated and unregulated constituents, including CECs. The monitoring program will be included in the approved groundwater replenishment permit for the GWR Project, including sampling locations, sampling frequencies, analytical methods, and reporting. |
| Operation and Optimization Plan | The intent of the plan is to assure that the facilities are operated to achieve compliance with the Groundwater Replenishment Regulations, to achieve optimal reduction of contaminants, and to identify how the project will be operated and monitored. | Prior to startup of the GWR Project, MRWPCA will develop and submit an Operations and Optimization Plan to DDW and the RWQCB that identifies the operations, maintenance, analytical methods, and monitoring necessary to meet DDW and RWQCB requirements. MRWPCA will update the Plan as necessary to make sure that it is representative of current operations, maintenance, and monitoring of the GWR Project. |

| | Requirements | Proposed Compliance Description |
|---|---|---|
| Response Plan | A project sponsor must obtain approval from DDW on a plan that describes the steps that will be taken to provide an alternative source of potable water to all users of a producing drinking water well or a DDW-approved treatment system for a well that as a result of a replenishment project as determined by DDW causes the well to violate drinking water standards, has been degraded so that is no longer a safe source of drinking water, or fails to meet the pathogen control requirements. | Prior to start-up of the GWR Project, MRWPCA will develop and submit a plan to DDW to provide an alternative source of water or a DDW-approved treatment system should the GWR Project impact a drinking water well so that it cannot be used was a water supply or the GWR Project fails to meet the pathogen control requirements. |
| Boundaries Restricting Locations of Drinking Water Wells | Project proponents must establish a "zone of controlled well construction," which represents the greatest of the horizontal and vertical distances reflecting the underground retention times required for pathogen control or for the RRT. Drinking water wells cannot be located in this zone. Project proponents must also create a "secondary boundary" representing a zone of *potential* controlled well construction that may be beyond the zone of controlled well construction, thereby requiring additional study before a drinking water well is drilled. | Based on the greater of the retention times established to meet the DDW pathogen control requirements or the RRT, MRWPCA will submit a map to DDW depicting the boundary representing the zone of controlled potable well construction and the secondary boundary. The map will also show the location of all monitoring wells and drinking water wells within a two-year travel time of the GWR Project. |
| Adequate Managerial and Technical Capability | A project sponsor must demonstrate that it possess adequate managerial and technical capability to comply with the regulations. The Safe Drinking Water Act (SDWA) requires public water systems to demonstrate their capability to provide a safe drinking water supply. To that end, DDW has developed a Technical Managerial and Financial Assessment (TMF) Form. For groundwater replenishment projects, DDW has indicated that project sponsors can use portions of the TMF form to demonstrate compliance with the managerial and technical capability requirements in the Groundwater Replenishment Regulations. | Prior to startup, MRWPCA will provide information demonstrating managerial and technical capability using the TMF Form; namely, information on certified operators, the operations plan, training, organization, the emergency response plan, and (as appropriate) policies. MRWPCA has operated an AWT pilot facility to demonstrate technical experience with operation of the AWT Facility and will provide DDW with an Operations and Optimization Plan for the GWR Project. |
| Engineering Report | The project sponsor must submit an Engineering Report to DDW and RWQCB that indicates how a groundwater replenishment project will comply with all regulations and includes a contingency plan to insure that no untreated or inadequately treated water will be used. The report must be approved by DDW. | MRWPCA will develop an Engineering Report that contains a description of the design of the GWR Project and clearly indicates how the GWR Project will comply with the Groundwater Replenishment Regulations. It is anticipated that the engineering report will be finalized and submitted to DDW in 2015. |
| Alternatives | Alternatives to any of the provisions in the Groundwater Replenishment Regulations are allowed if the project sponsor demonstrates that: the alternative provides the same level of public health protection; the alternative has been approved by DDW; and an expert panel has reviewed the alternative unless otherwise specified by DDW. | MRWPCA will not seek alternatives to any of the provisions of the Groundwater Replenishment Regulations. |
| ***SWRCB Policy and RWQCB Basin Plan Requirements*** | | |
| | **Requirement** | **Proposed Compliance Descriptions** |
| Anti-degradation Policy | The State Anti-degradation Policy requires that existing high quality (including groundwater be maintained to the maximum extent possible, but allows lowering of water quality if the change is consistent with maximum benefit to the people of the state, will not unreasonably effect present and anticipated use of such water, and will not result in water quality less than prescribed in policies. The Anti-degradation Policy also stipulates that any discharge to existing high quality | The GWR Project will meet the Anti-degradation Policy by creating purified water for injection that is of higher quality than the local groundwater, meets Basin Plan objectives, and protects groundwater beneficial uses; by utilizing advanced treatment technologies that result in best practicable treatment or control; and by recycling water, which in accordance with the State Recycled Water Policy is a maximum benefit to the people of the State. |

| | Requirements | Proposed Compliance Description |
|---|---|---|
| | waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control of the discharge to ensure that (a) pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained. | |
| Recycled Water Policy | Assimilative Capacity - A groundwater replenishment project that utilizes less than 10% of the available assimilative capacity in a groundwater basin/sub-basin (or multiple projects utilizing less than 20% of the available assimilative capacity in a groundwater basin/sub-basin) is only required to conduct an anti-degradation analysis verifying the use of the assimilative capacity. In the event a project or multiple projects utilize more than the fraction of the assimilative capacity (e.g., 10% for a single project or 20% for multiple projects), the project proponent must conduct a RWQCB-deemed acceptable (and more elaborate) anti-degradation analysis. | The GWR Project would utilize less than 10% of the assimilative capacity and therefore does not require a more detailed anti-degradation analysis. The GWR Project purified water would be treated and stabilized to meet all drinking water quality objectives and other Basin Plan objectives. Further, the GWR Project purified water would be expected to have a higher quality water than ambient groundwater with respect to total dissolved solids (TDS), chloride, and nitrate. As such, the GWR Project will neither cause a violation of a groundwater quality standard nor adversely impact beneficial uses, and would have a beneficial effect on local groundwater quality. |
| | Impact on Contaminant Plumes – If necessary, a RWQCB may impose requirements on a proposed groundwater replenishment project that has a substantial adverse effect on the fate and transport of a contaminant plume (for example those caused by industrial contamination or gas stations. | No documented groundwater contamination or contaminant plumes have been identified in the GWR Project area. Therefore, injection associated with the GWR Project would not exacerbate existing groundwater contamination or cause plumes of contaminants to migrate. As a result, additional RWQCB requirements related to groundwater contaminants would not be necessary for the GWR Project. |
| | Dissolution of Contaminants - If necessary, a RWQCB may impose requirements on a proposed groundwater replenishment project that changes the geochemistry of an aquifer thereby causing the dissolution of naturally occurring constituents, such as arsenic, from the geologic formation into groundwater. | The risk of geochemical impacts from incompatibility would be addressed at the proposed AWT Facility by including a stabilization process to ensure that the purified water is stabilized, non-corrosive, and prevents dissolution in the geologic formation. |
| | CEC Monitoring - For subsurface injection projects, based on the recommendations of an expert panel, the Recycled Water Policy establishes a list of specific health-based CEC indicators, performance-based CEC indicators, and surrogates that must be monitored in recycled water after RO or after RO/AOP, depending on the specific indicator/surrogate. The Recycled Water Policy also establishes procedures for evaluating data and actions to be taken depending on the monitoring results. | MRWPCA will monitor the CECs and unregulated chemicals and surrogates in the AWT Facility purified water as specified by the Recycled Water Policy, and will evaluate data and implement any follow-up actions based on monitoring results. For performance indicator CECs, MRWPCA will compare water quality before treatment by RO/AOP and prior to injection. If the performance changes over time, MRWPCA will evaluate if there are changes in the incoming concentration of the CEC indicator or if RO/AOP treatment system performance has changed. For health indicator CECs, MRWPCA will compare the purified water quality to the Policy's Monitoring Trigger Levels (MTLs), and based on the results take follow up actions including additional monitoring, discussion with DDW and RWQCB, and implementing studies. |
| Basin Plan Requirements | Per the Basin Plan, the Seaside Groundwater Basin is suitable for agricultural (AGR), municipal and domestic supply (MUN), and industrial use. The Basin Plan establishes general narrative groundwater objectives for taste and odor and radioactivity that apply to all groundwater basins; for MUN, groundwater objectives | Based on the source water sampling, piloting testing results, and pertinent research, the purified water that would be produced by the RTP and full-scale AWT Facility would meet all Basin Plan objectives and guidelines. MRWPCA will confirm compliance with the Basin Plan by monitoring the quality of the |

| | Requirements | Proposed Compliance Description |
|---|---|---|
| | for bacteria and primary and secondary MCLs, and for AGR beneficial uses, groundwater guidelines and objectives to protect soil productivity, irrigation, and livestock watering and objectives for irrigation supply and livestock watering. | AWT Facility purified water and groundwater. |

## 20. Glossary

**Acre-foot** – A unit of volume that is one acre in area by one foot in depth.

**Advanced Oxidation** – A chemical oxidation process that relies on the production of a hydroxyl radical for the destruction of trace organic constituents found in water.

**Advanced Water Treatment** – Wastewater treatment technologies used to remove total dissolved solids, pathogens, trace organics, and or other trace constituents for specific reuse applications.

**Alkalinity** – The acid neutralizing capacity of solutes in a water sample, reported in mill equivalents of calcium carbonate per liter.

**Anthropogenic** – Being derived from human activities, as opposed to those occurring in natural environments without human influences.

**Aquifer** – A geologic formation under the ground that is saturated with groundwater and sufficiently permeable to allow movement of quantities of water to wells and springs.

**Assimilative Capacity** – The condition in which existing water quality is better than that required to support the most sensitive beneficial use(s) of a groundwater basin, i.e., a contaminant concentration in groundwater is below the applicable water quality objective. It is also the difference between water quality objectives and average ambient groundwater quality in the groundwater basin.

**Biologically Activated Filtration** – Biological filters that remove contaminants by three main mechanisms: biodegradation, adsorption, and filtration of suspended solids.

**Brine** – A waste stream containing elevated concentrations of total dissolved solids.

**California Environmental Quality Act (CEQA)** – A California law that requires State and local agencies determine the potential significant environmental impacts of proposed projects and identify measures to avoid or mitigate these impacts where feasible. The CEQA Guidelines, which provide the protocol by which State and local agencies comply with CEQA requirements, are detailed in California Code of Regulations, Title 14 § 15000 et seq. The basic purposes of CEQA are to: (1) inform decision makers and public about the potential significant environmental effects of a proposed project, (2) identify ways that environmental damage may be mitigated, (3) prevent significant, avoidable damage to the environment by requiring changes in projects, through the selection of alternative projects or the use of mitigation measures when feasible, and (4) disclose to the public why an agency approved a project if significant effects are involved (California Code Regulations, Title 14, § 15002(a)).

**Concentrate** – The portion of a feed stream that retains the constituents that were rejected during reverse osmosis treatment.

**Constituent** – A term used to describe either a chemical or compound.

**Constituents of Emerging Concern** – Constituents of emerging concern are generally chemicals for which there are no established water quality standards. These chemicals may be present in waters at very low concentrations and are now detected as the result of more sensitive analytical methods. CECs include several types of chemicals such as pesticides, pharmaceuticals and ingredients in personal care products, veterinary medicines, endocrine disruptors, and others.

**Clean Water Act** – Federal law that is the cornerstone of surface water quality protection in the United States. The statute employs a variety of regulatory and non-regulatory tools to reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff.

**Conductivity** – A measure of the ability of an aqueous solution to carry an electric current.

***De Minimis* Risk** – A level of risk that the scientific and regulatory community asserts is too insignificant to regulate.

**Disinfection By-products** – Chemicals that are formed with the residual matter found in treated reclaimed water as a result of the addition of a strong oxidant, such as chlorine or ozone, for the purpose of disinfection.

**Environmental Impact Report (EIR)** – An EIR is a detailed report written by the lead agency describing and analyzing the significant environmental effects of a proposed project, identifying alternatives and discussing ways to reduce or avoid the possible environmental damage.

**Endocrine Disrupting Chemicals** – Synthetic and natural compounds that mimic, block, stimulate or inhibit natural hormones in the endocrine systems of animals, humans, and aquatic life.

**Epidemiology** – The study of disease patterns in human populations.

**Flux** – The flow rate per unit of membrane surface area.

**Groundwater** – Water found in the spaces between soil particles and cracks in rocks underground.

**Groundwater Gradient** – The slope of the water table.

**Groundwater Mounding** – An outward and upward expansion of the free water table caused by surface or sub-surface recharge. Mounding can alter groundwater flow rates and direction; however, the effects are usually localized and may be temporary, depending upon the frequency and duration of the surface recharge events.

**Groundwater Replenishment** – The process of adding a water source such as recycled water to aquifers under controlled conditions to supplement groundwater or act as a barrier to prevent seawater from entering the aquifer. Water can be recharged by infiltration in spreading basins, injection wells, or vadose zone wells.[45]

**Indicator** – An individual compound or chemical that represents the physical, chemical, and biodegradable characteristics of a specific family of trace organics.

***In vitro*** – Biological studies that take place in isolation from a living organism, such as a test tube or Petri dish.

***In vivo*** – Biological studies that take place within a living organism.

**Maximum Contaminant Levels (MCLs)** – The highest level of a contaminant that is allowed in drinking water and is protective of human health.

**Membrane** – A membrane is thin layer of material that will only allow certain constituents to pass through it. Which material will pass through the membrane is determined by the size and the chemical characteristics of the membrane and the material being filtered.

**Membrane Treatment (or Microfiltration)** – A treatment system that passes liquid through semipermeable membranes to exclude suspended solids (typically solids that are larger than 0.03 to 0.3 $\mu$m).

**Microgram per liter** – A concentration unit of measurement that is one millionth of a gram per volume of water in liters. It is equivalent to one part per billion.

**Milligram per liter** – A unit of measurement that is one thousandth of a gram per volume of water in liters. It is equivalent to one part per million.

**Minimum Reporting Level** – An estimate of the lowest concentration of a compound that can be detected in a sample for which the concentration can be quantified and reported with a reasonable degree of accuracy and precision.

**Monitoring Well** – Specially constructed wells used for collecting representative samples of ground water for water quality testing.

**Most Probable Number** – An index of the number of coliform bacteria that, more probably than any other number, would give the results shown by laboratory examination; it is not an actual enumeration.

**Nanogram per liter** – A unit of measurement that is one billionth of a gram per volume of water in liters. It is equivalent to a part per trillion.

**National Pollutant Discharge Elimination System (NPDES) Permit** – Permit required for all point sources discharges of pollutants to surface waters.

**Notification Levels (NLs)** – Health-based advisory levels established by the State Water Resources Control Board Division of Drinking Water for chemicals in drinking water that lack Maximum Contaminant Levels. When chemicals are found at concentrations greater than their NLs, certain requirements and recommendations apply to drinking water purveyors.

**Ozonation** – A chemical oxidation treatment process that uses ozone to react with contaminants in water. It is also used for disinfection.

**Pathogens –** Microorganisms including bacteria, protozoa, helminthes, and viruses capable of causing disease in animals and humans.

**Percolation** – The flow or filtering of water or other liquids through subsurface rock or soil layers, usually continuing to groundwater.

---

[45] Note: The CWC defines groundwater recharge as follows: "Indirect potable reuse for groundwater recharge" means the planned use of recycled water for replenishment of a groundwater basin or an aquifer that has been designated as a source of water supply for a public water system, as defined in Section 116275 of the Health and Safety Code.

**Permeate** – The liquid stream that passes through a membrane.

**Pesticide** – (a) Chemical used to kill destructive insects or other small animals. (b) A general term for insecticides, herbicides and fungicides. Insecticides kill or prevent the growth of insects. Herbicides control or destroy plants. Fungicides control or destroy fungi. Some pesticides can accumulate in the food chain and contaminate the environment.

**pH** – A measure of the acidity or alkalinity of a substance.

**Pilot-scale Treatment Studies** – Studies that typically use treatment units that are significantly smaller than needed for full-scale operation, but that are large enough to accurately represent treatment behavior at full-scale. They can be used to evaluate the effectiveness of different types of treatment processes or different vendors of the same treatment process.

**Protozoa** – Single celled organisms such as *Giardia* and *Cryptosporidium*.

**Plume** – A body of contaminated groundwater flowing from a specific source.

**Potable Reuse** – The planned use of recycled water to augment drinking water supplies.

**Publicly Owned Treatment Work** – A wastewater treatment plant owned by a state or municipality.

**Primary Maximum Contaminant Level** – Numeric standards or treatment technologies established by the United States Environmental Protection Agency and the California Department of Public Health to protect public health.

**Primary Treatment** – A treatment process that allows for heavier solids in raw sewage to settle to the bottom of a tank and for the lighter materials, like plastic and grease, which float to the top, to be skimmed and removed and recycled back into the treatment process.

**Priority Pollutants** – The 126 chemical pollutants regulated by the U.S. Environmental Protection Agency. The current list chemicals can be found in Appendix A of Section 40 of the Code of Federal Regulations, Part 423.

**Purified Water** – Recycled water that has been produced using advanced treatment.

**Quality Assurance/Quality Control** – A set of operating principles that, if strictly followed during sample collection and analysis, will produce data of known and defensible quality.

**Quality of the water** – Refers to chemical, physical, biological, bacteriological, radiological, and other properties and characteristics of water that affect its use.

**Recycled Water** – Domestic or municipal wastewater which has been treated to a quality suitable for a beneficial use.

**Redundancy** – The use of multiple treatment barriers for the same contaminant, so that if one fails, performs ineffectively, or is taken off-line for maintenance, the system still effectively performs and risk is reduced

**Reliability** – For direct potable reuse, to consistently achieve the desired water quality. A reliable system is redundant, robust and resilient.

**Reverse Osmosis** – A treatment process where pressure greater than the osmotic pressure is applied to water to drive the more concentrated solution to the other side of the membrane and the membrane acts as a barrier to contaminants, such as salts. The permeate water passes through the membrane and has reduced contaminant concentration. A reject flow stream is produced that contains salts and other constituents rejected by the membrane process.

**Runoff** – Rainfall or snow melt which is not absorbed by soil, evaporated, or transpired by plants, but finds its way into streams as surface flow.

**Safe Drinking Water Act** – The main federal law that ensures the quality of United States drinking water.

**Salinity** – Of, characteristic of, or containing common salt, or sodium chloride; salty.

**Salt Water Intrusion** – The invasion of a body of fresh water (surface or ground water) by a body of salt water.

**Secondary Maximum Contaminant Level** – Water quality standard established to manage drinking water for aesthetic considerations, such as taste, color, and odor. Contaminants with only secondary MCLs are not considered to pose a risk to human health.

**Secondary Treatment** – A biological treatment process used for the removal of soluble organic matter and particulates using microorganisms. The microorganisms form flocculant particles that are separated from the water using sedimentation (settling), and the settled material is returned to the biological process or wasted.

**Surrogate** – A measurable physical or chemical property that has can be used to measure the effectiveness of trace organic removal by a treatment process. For example, a reverse osmosis treatment process is expected to substantially reduce the electrical conductivity (salinity) of the recycled water being treated. Surrogates, such as coliforms, are also used in place of directly measuring pathogens.

**Tertiary Recycled Water** – Recycled water that has been processes using tertiary treatment and meets requirements in California Code of Regulations, Title 22.

**Tertiary Treatment** – A treatment process where wastewater that has undergone secondary treatment is processed using granular media or carbon filters and then disinfected.

**Total Dissolved Solids** – An overall measure of the minerals in water. Total salinity is commonly expressed in terms of TDS as milligrams per liter (mg/L). Elevated TDS concentrations above the Secondary Maximum Contaminant Level of 1,000 mg/L are undesirable for aesthetic reasons related to taste, odor, or appearance of the water and not for health reasons.

**Total Nitrogen** – The sum of organic nitrogen, nitrate, nitrite, and ammonia expressed as nitrogen.

**Total Organic Carbon** – The concentration of organic carbon present in water, both dissolved and suspended.

**Tracer** – A non-reactive substance, with measurable characteristics distinctly different from the receiving groundwater. Tracers can be added to recycled water or intrinsically present in recycled water.

**Treatment** – Any process that changes the physical, chemical, or biological character of a water or wastewater.

**Treatment Process –** A combination of treatment operations and processes used to produce water meeting specific water quality levels.

**Ultraviolet** – UV irradiation is the process by which chemical bonds of the contaminants are broken by the energy associated with UV light (photolysis). UV also has germicidal properties and is used for disinfection.

**Vadose Zone** (also called **Unsaturated** zone) – The area between the land surface and the regional groundwater table (upper surface of the groundwater).

**Vadose Zone well** – A vadose zone well is an injection well installed in the unsaturated zone above the water table. These wells typically consist of a large-diameter borehole with a casing/screen assembly installed with a filter pack. The well is used as a conduit for transmitting water into the subsurface, allowing infiltration into the vadose zone through the well screen and percolation to the underlying water table.

**Water Quality** – A term used to describe the chemical, physical, and biological characteristics of water, usually in respect to its suitability for a particular purpose.

**Water Quality Standards** – Beneficial uses of groundwater and water quality objectives to protect beneficial uses.

**Wastewater** – Liquid waste discharged from municipal activities, including residential, commercial, and industrial activities.

**Well Yield** – The amount of water that can be pumped from a given well per unit of time.

# Appendix A
# June 5, 2014 Letter from the Division of Drinking Water Regarding the Pure Water Monterey Groundwater Replenishment Project Concept

State of California—Health and Human Services Agency
California Department of Public Health

RON CHAPMAN, MD, MPH
Director & State Health Officer

EDMUND G. BROWN JR.
Governor

June 5, 2014

Robert Holden, Principal Engineer
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

Dear Mr. Holden:

**Pure Water Monterey Groundwater Replenishment Project Concept**
**Monterey Regional Water Pollution Control Agency- Recycled Water System No. 2790002**

The California Department of Public Health (CDPH) has reviewed the DRAFT May 19, 2014 *Monterey Regional Water Pollution Control Agency, Pure Water Monterey Groundwater Replenishment Project, Proposal to Inject Highly-Treated Recycled Water into the Seaside Groundwater Basin*. The purpose of this letter is to respond to the Monterey Regional Water Pollution Control Agency (MRWPCA)'s request for CDPH review and approval of the project concept. CDPH has developed draft groundwater replenishment regulations. MRWPCA has committed to meet the requirements specified in the CDPH draft groundwater replenishment regulations.

The MRWPCA proposed project for groundwater injection will involve injecting highly-treated recycled water from a proposed new advanced water treatment facility (AWTF) into the Seaside Groundwater Basin. The AWTF would receive secondary effluent from the MRWPCA Regional Treatment Plant (RTP) as source water for treatment. The following is a list of the proposed AWTF processes:

- ozonation,
- biologically active filtration (optional),
- membrane filtration (MF) treatment,
- reverse osmosis (RO) membrane treatment, and
- advanced oxidation process using ultraviolet light and hydrogen peroxide ($H_2O_2$).

The proposed pathogen reduction credits for the unit processes and underground retention time are shown in Table 1, *Proposed Pathogen Reduction Credits for AWT Processes* in the Draft Proposal. These pathogen reduction credits must be substantiated in the engineering report and operations plan. Please note that RO via online TOC or conductivity monitoring can only demonstrate 1.0 to 1.5 log removal rather than 2 log removal. Still, the log reduction credits for viruses, Giardia, and Cryptosporidium should far exceed the log reduction requirements in the draft CDPH groundwater replenishment regulations. The extra log removal credits will provide an additional safeguard to ensure adequate pathogen reduction.

To obtain CDPH approval for an actual project, MRWPCA must provide an adequate basis for CDPH to make a finding that the project meets the requirements in the Health & Safety Code (H&S Code). CDPH has authority to condition a permit (H&S Code Section 116540) "as it deems necessary to assure a reliable and adequate supply of water at all times that is pure, wholesome, potable, and does not endanger the health of consumers". Nothing in this letter is intended to waive CDPH's authority.

Based on CDPH's review of MRWPCA's draft concept proposal, CDPH has concluded that the project, as conceived, when properly designed, constructed, and operated, should meet the requirements in the draft CDPH groundwater replenishment regulations. Therefore, CDPH conditionally approves the *Pure Water Monterey Groundwater Replenishment Project, Proposal to Inject Highly-Treated Recycled Water into the Seaside Groundwater Basin* Draft Concept. At a minimum, the conditions and future submittal requirements are described below.

**Future Submittals**
In order for CDPH to make the finding that the project poses no significant threat to public health and recommend issuance of a permit, MRWPCA will need to provide the additional information outlined below, including, but not limited to: engineering report, the final design, contingency plan, operations plan, response plan, water quality monitoring plan, and monitoring well locations.

Engineering Report, Final Design and Contingency Plan
Once project details are finalized, the project's Engineering Report must be submitted to CDPH for review and approval. Please refer to the current draft recharge regulations for guidance on content. Final design must be reviewed and approved before start of construction. The Engineering Report must contain an AWTF contingency plan which will assure that no untreated or inadequately-treated wastewater will be delivered to the use area.

Operations Plan
An Operations Plan must be developed to optimize individual treatment unit processes. Real-time monitoring with online instruments must be implemented to track, verify, and optimize performance of critical treatment processes in order to protect public health. The current demonstration project should provide data that would assist in accomplishing this. Full-scale commissioning and startup testing should finalize the treatment optimization process and be incorporated in the final Operations Plan.

Response Plan
Prior to operation, MRWPCA must submit a response plan for review and approval that will be implemented if needed to respond to a failure to meet product water quality requirements. The response plan should describe the steps to provide either:

1. an alternative source of drinking water supply to all users of a drinking water well, or
2. an approved treatment mechanism provided to all owners of a drinking water well

Water Quality Monitoring and Operational Reliability
Prior to discharge to Seaside Groundwater Basin, MRWPCA must develop and submit for approval a comprehensive Water Quality Monitoring Plan to determine compliance with all drinking water maximum contaminant levels (MCLs) and other pertinent standards. In addition, the Monitoring Plan shall include a sampling and analytical strategy for chemicals for which CDPH has established notification levels. To ensure proper performance of unit operations, full-scale commissioning and startup testing is required. This will confirm appropriate surrogate parameters and performance

indicator compounds that are tailored to monitor the contaminant removal efficiency of individual unit processes.

Seaside Groundwater Basin and Monitoring Well Requirements
The number and proper location of monitoring wells must be justified. Based on information provided to date, an additional set of monitoring wells may be needed to evaluate water quality along the path of flow from the GWR Well Site #3 to the ASR Wells 1 and 2. CDPH understands that MRWPCA intends to perform a tracer study to determine travel time to the nearest drinking water wells and confirm the theoretical estimates from the modeling.

Technical and Managerial Capacity, with Focus on Treatment Plant Operators
Adequate technical and managerial capacity must be demonstrated by the MRWPCA for the project. The MRWPCA must hire, train, and retain a sufficient number of qualified operators. A response/contingency plan including communication and notification procedures must be developed to address serious water quality problems arising from treatment plant failures that could compromise the use of Seaside Groundwater Basin as a source of drinking water.

CDPH staff will continue to be available to your staff for technical discussions and to answer questions on CDPH's requirements for the project.

If you have any questions, please feel free to contact Jan Sweigert at (831) 655-6934 or myself at (510) 620-3474.

Sincerely,

Stefan Cajina, P.E., Chief

**Monthly Blend Composition from Various Source Waters under Phase B, Drought Scenario**

Previous Interagency agreements established entitlements to recycled water produced from the existing municipal wastewater flows to the Regional Treatment Plant (RTP). As source flows for the GWR Project were studied and the seasonal variability of each was understood, the stakeholder Agencies entered into a Memorandum of Understanding Regarding Source Waters and Water Recycling (MOU). The Parties to the MOU are the Monterey Regional Water Pollution Control Agency, the Monterey County Water Resources Agency, the City of Salinas, the Marina Coast Water District (MCWD), and the Monterey Peninsula Water Management District. The MOU is an agreement to "negotiate a Definitive Agreement to establish contractual rights and obligations of all Parties," and includes (1) protection of MCWD's recycled water right entitlement, (2) provision of recycled water to Monterey County Water Resources Agency for Castroville Seawater Intrusion Project, (3) definition of a Phase A consisting of provisions for assuring adequate source water for the GWR Project and additional water for the existing Castroville Seawater Intrusion Project service area, and (4) definition of a Phase B that would increase diversion and use of the new source waters to benefit Castroville Seawater Intrusion Project. The MOU also includes provisions for creation of a drought reserve by producing up to 200 acre-fee per year (AFY) of additional purified water during wet and normal years for injection in the Seaside Groundwater Basin. During dry years, the GWR Project would reduce production to allow more of the source water to supply the Salinas Valley Reclamation Plant and Castroville Seawater Intrusion Project.

Water rights permits from the State Water Resources Control Board would be required for surface water diversions from the Reclamation Ditch, Blanco Drain, and Tembladero Slough. It is anticipated that these permits would be processed in two steps, defined as Phase A and B. Permits for diversion rates less than 3 cubic feet per second (cfs) may be processed as administrative actions, and would be requested initially. Diversions at greater rates require a more detailed permitting process, and could replace or amend the initial permits. For Phase A of the GWR Project, the estimated yields are based on diverting up to 2.99 cfs from each source. For Phase B of the Proposed Project, the diversion rates for the

Reclamation Ditch and Blanco Drain would be increased to up to 6 cfs. A maximum expected diversion flow has been developed based on an assessment of infrastructure capacity and peak flow availabilities in those water bodies. Flows in these channels are less seasonal than urban runoff, but still peak in the winter months during rain events. These sources would be diverted when flows are available and when the other sources of supply are not sufficient to meet the full Project demands. Radio-controlled supervisory control and data acquisition equipment at each diversion pump station would allow the system operators to adjust the diversion rates in response to daily rainfall and irrigation conditions.

## Fugitive Dust Emission Factors

### Type = Area

### General Grading and Earth Moving Fugitive Dust

| | Uncontrolled | | | Mitigated | |
|---|---|---|---|---|---|
| PM10 = | 20.0 | lbs/acre | | 7.0 | lbs/acre |
| PM2.5= | 4.16 | lbs/acre | | 1.5 | lbs/acre |

The Midwest Research Instituteidentifed a PM10 fugitive dust emission rate of 0.11 tons/acre/month, which converts to 10 pounds per day. Since the factor includes some watering at sites, it was adjusted assuming 50% control. Sites with best management practices could attain 65% control (with mitigation).

### Type = Pipeline/Trench

### Fugitive Dust from Excavation and Soil Handling

| | pounds PM per ton material | tons material per cubic yard | PM pounds per cubic yard |
|---|---|---|---|
| PM10 = | 0.001292763 | 1.2641662 | 0.001634267 |
| PM2.5= | 0.000195761 | 1.2641662 | 0.000247475 |

Based on AP-42 Emission Factor: EF (lbs/ton) = k (0.0032)(U/5)^1.3 / (M/2)^1.4

Where:

EF = emission rate in pounds PM10 or PM2.5 per ton material handled.

k = particle size multiplier (assumed 0.35 for PM10 and 0.0.053 for PM2.5)

U = mean wind speed (assummed to be 7.1 mph per CalEEMod)

M = material moisture content (assummed 7.9% per CalEEMod for bulldozing).

### Type = Road (unpaved)

### Unpaved Fugitive Dust From Truck Travel

| | Trucks | Workers |
|---|---|---|
| PM10 = | 2.0 | 0.8 |
| PM2.5= | 0.2 | 0.1 |

Based on AP-42 Emission Factor: E (lbs/VMT) = k (s/12)^a (W/3)^b

Where:

E = emission rate in pounds per vehicle mile traveled

k = particle size multiplier (assumed 1.5 lb/VMT for PM10 and 0.15 lb/VMT for PM2.5 per AP-42, Table 13.2.2-2)

a = 0.9

b = 0.45

s = silt content (assumed 6.9% per CalEEMod)

W, truck weight = 80% wiegh 20 tons and 20% weigh 2 tons = 16.4 tons

W, worker vehicle weight = 2 tons

**Project Name:** Pure Water Monterey Groundwater Replenishment

**Site Name:** SIWTF Storage and Recovery

**Includes recovery pump station, pond 3 pump station and on-site gravity lines. Force main is separate sheet.**

See Equipment Type TAB/sheet for type, horsepower and load factor

| Jack-and-Bore Rig | 350 | 1 | 8 | 40 | | 4 sites at 2 weeks each |
| Loader | 90 | 1 | 8 | 109 | 68+40+16 | pipe excavation & backfill +bore & jack + paving |
| Generator | 200 | 1 | 8 | 109 | | I assume the generator is for hand tools |

**Notes**: Construction would last 10 months. Jack and bore would occur at four locations for two weeks each: Lightfighter Dr, Gigling Rd, Normandy Rd, and Eucalyptus Rd. There would be approximately 21 workdays per month.

**AWT Pump Station**

| Off Road Equipment | Approx. HP | Number | Hour/Day | Days | Comment |
|---|---|---|---|---|---|
| Pavers | 160 | 1 | 8 | 3 | Comment: Grading and paving will get taken up by all the rest of the treatment plant site work |
| Rollers | 90 | 1 | 8 | 5 | |
| Loader | 90 | 1 | 8 | 20 | The actual days specifically associated w/ the AWTPS are guesses |
| Backhoe | 150 | 1 | 8 | 15 | |
| Cranes | 200 | 1 | 8 | 30 | Hiatus between structural work and mechanical installation |
| Graders | 200 | 1 | 8 | 3 | |
| Generator | 200 | 1 | 8 | 60 | Power for small tools might be availablel from existing electrical outlets of PCA' RTP |

**Notes**: Construction would last 12-14 months. Structural work requiring heavy equipment will be completed in 2-3 months.

**Booster Pump Station (RUWAP or Coastal)**

| Off Road Equipment | Approx. HP | Number | Hour/Day | Days | Comment |
|---|---|---|---|---|---|
| Pavers | 160 | 1 | 8 | 3 | |
| Rollers | 90 | 1 | 8 | 5 | |
| Loader | 90 | 1 | 8 | 10 | |
| Backhoe | 150 | 1 | 8 | 10 | |
| Cranes | 200 | 1 | 8 | 30 | Hiatus between structural work and mechanical installation |
| Graders | 200 | 1 | 8 | 2 | |
| Generator | 200 | 1 | 8 | 180 | Need for a generator is dependant on whether PG&E will make a temporary electrical "drop" for the contractor's use, before the permanent permanent power supply is available. |

**Notes**: Construction would last 10-12 months. Structural work requiring heavy equipment will be completed in 2-3 months.

**Project Name:** Pure Water Monterey Groundwater Replenishment
**Site Name:** Injection Well Facilities

**Includes injection wells, monitoring wells, backflush basin, connecting pipelines and conduits, road surfacing**

See Equipment Type TAB/sheet for type, horsepower and load factor

**OPERATIONAL AIR QUALITY ANALYSIS**

**Illingworth & Rodkin, Inc.**

**December 2014**

Table 2-11

## Overview of Electricity Demand (all in megawatt-hours per year)

| | Proposed Project Electricity Demand | Applicant-proposed electricity use reductions: Use of VFD motors on AWT and Product Water Pumps |
|---|---|---|
| **<u>Source Water Diversion Sites</u>**<br>(Source: Vinod Badani, E2 Consulting, October 2014, except as noted) | | |
| Existing MRWPCA Wastewater Collection System Pump Stations<br>(increased pumping for source water collection) (Source: Bob Holden, MRWPCA, October 2014) | 1,100 | |
| Proposed Salinas Pump Station Diversions<br>(lighting, SCADA, misc. electricity) | 10 | |
| Proposed Salinas Industrial Wastewater Treatment Plant Storage and Recovery Component<br>(pumping, lighting, SCADA, misc. electricity) | 224 | |
| Existing Salinas Treatment Facility and Stormwater Operations<br>(reduction of pumping) (Source: Ron Cole, February 2014 modified by MRWPCA staff October 2014) | (1,875) | |
| Proposed Reclamation Ditch Diversion<br>(pumping, lighting, SCADA, misc. electricity) | 250 | |
| Proposed Tembladero Slough Diversion<br>(pumping, lighting, SCADA, misc. electricity) | 461 | |
| Proposed Blanco Drain Diversion<br>(pumping, lighting, SCADA, misc. electricity) | 731 | |
| Proposed Lake El Estero Diversion<br>(lighting, SCADA, misc. electricity) | 10 | |
| **<u>Treatment Facilities at Regional Treatment Plant</u>**<br>(Sources: Bob Holden, MRWCPA, and Alex Wesner, SPI, personal communication, October 2014) | | |
| **Existing Primary and Secondary Processes**<br>(existing on-site cogeneration facility would provide a reduction in this value)<br>(9,900 AFY more wastewater flows through treatment processes) | 3,673 | |
| **Salinas Valley Reclamation Plant**<br>(4,260 AFY more crop irrigation produced) | 1,300 | |
| **AWT Facility**<br>New treatment facilities, not including product water pumping (assumes 3,700 AFY of water production to build drought reserve; demand will be less when Drought Reserve is at full capacity and when Drought Reserve is being used by CSIP) | 7,007 | 793 |
| **<u>Castroville Seawater Intrusion Project Supplemental Wells</u>**<br>(Source: Bob Holden, MRWPCA, October 2014) | | |
| Reduction of use of CSIP Supplemental Wells by 4,260 AFY | (1,900) | |
| **<u>Product Water Conveyance</u>**<br>(Source: TG Cole, October 2014) | | |
| Pumping of product water to Injection Well Facilities under either option (RUWAP or Coastal) | 1,912 | 18 |
| **<u>Injection Well Facilities</u>**<br>(Source: Vinod Badani, E2 Consulting Engineers, October 2014) | | |
| Back-flush of four (4) deep injection wells, lighting, HVAC, meters, instruments, SCADA | 147 | |
| **<u>CalAm Distribution System Changes</u>**<br>(Source: CalAm, 2014) | | |
| Increase by moving 3,500 afy extractions from Carmel River to Seaside Basin wells | 630 | |
| **TOTAL PROPOSED NEW ELECTRICITY DEMAND** | **13,678** | **811** |
| **Proposed New Electricvity Generation without Cogeneration or VSD** | **14,489** | |
| **Proposed New Electricity Generation at Existing Cogen Facility** | **2,726** | |
| **Net Proposed New Electricity Demand (in megawatt-hours per year)** | **10,952** | |

910

11,980

## Net Change in CalAm System Operations

| | | |
|---|---|---|
| less carmel river well extractions | 462 | kWh/af |
| more seaside GW basin well extractions | 642 | kWh/af |
| **net increase in electricity by switching the source** | **180** | **kWh/af** |
| Increase by moving 3,500 afy extractions from Carmel River to Seaside Basin | 630,000 | kwh/yr |

630 mWh/yr

Source: California American Water Company (CalAm), 2014. Proposed Water Portfolio Data plus energy spreadsheet provided to CPUC by John T. Kilpatrick on March 12, 2014.

## GHG OPERATIONAL EMISSIONS

| Indirect Emissions from Net New Electricity Consumption (including new cogeneration capabilities enabled by source water carbon content) | | | |
|---|---|---|---|
| GHGs from Electricity Consumption | | | |
| GHG | Emission Factor (lb/kWh) | Electricity Consumption kWhr | CO2e* (metric tons) |
| CO2 | 0.32800 | 10,952,043 | 1,629.44 |
| CH4 | 0.00003 | 10,952,043 | 3.01 |
| N20 | 0.00001 | 10,952,043 | 9.50 |
| | | **Total =** | **1,642** |

| Indirect Emissions from Project Electricity Consumption (assuming no energy efficiency measures) | | | |
|---|---|---|---|
| GHGs from Electricity Consumption | | | |
| GHG | Emission Factor (lb/kWh) | Electricity Consumption kWhr | CO2e* (metric tons) |
| CO2 | 0.32800 | 14,488,600 | 2,155.61 |
| CH4 | 0.00003 | 14,488,600 | 3.99 |
| N20 | 0.00001 | 14,488,600 | 12.57 |
| | | **Total =** | **2,172** |

Notes: The emission factor for CO2 was obtained from PG&E, 2013. Emission factors for CH4 and N2O are from USEPA, 2012b.
Project baseline and proposed electricity consumption estimates provided by MRWPCA, October 2014.
*Global Warming Potential for CH4 = 21; GWP for N2O = 310 (CCAR, 2009).

| On-road Sources | Miles/trip | One way Trips per year | Running Exhaust Emission Factor (pound/mile) $CO_2$ | $CH_4$ | N2O | Total Emissions (Metric tons) $CO_2$ | $CH_4$ | N2O | $CO_2e$ | Fuel efficiency mpg | Fuel use gal/year |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Light duty truck (gas) | 10 | 8,030 | 0.79 | 9.96E-05 | 1.92E-04 | 28.88 | 0.00 | 0.006994084 | 31.13 | 15 | 5,353 |
| Heavy duty truck | 25 | 624 | 3.61 | 1.12E-05 | 1.06E-05 | 25.54 | 0.00 | 7.48795E-05 | 25.57 | 5 | 3,120 |
| | | | | | **Totals =** | **54.43** | **0.00** | **0.007068964** | **56.70** | | **8,473** |

Notes: Emission factors for mobile sources were derived from EMFAC2011 for the year 2018 (see CalEEMod Emfac 2011 Onroad Emission Factors). It is assumed that 11 employees would each generate two light duty truck trips each per day (22 total one way); 7 days per week (365 days per year), and that there would be six (6) weekly heavy duty truck deliveries or 12 one way trips per week (52 weeks per year).

| | |
|---|---|
| Total GHG Emissions (metric tons per year of CO2e) = | 1,699 |
| Total GHG Emission (based on 2003) = | 2,229 |
| **% GHG reduction =** | **24%** |

**NOTES:**

Treatment of the Agricultural Washwater at the Regional Treatment Plant (where methane is captured) rather than at the Salinas Industrial Wastewater Treatment Facility (where decomposition of organic matter in the wastewater occurs but it is not captured) would also reduce GHG emissions of the project. The project proposes storage and recovery of the water at the SIWTF, and thus some decomposition of organic matter in the ag wash water would still occur at the SIWTF in those waters stored. For this reason, this analysis conservatively does not account for this benefit.

## ON-ROAD OPERATIONAL CRITERIA POLLUTANT EMISSIONS

### Emission Factors

| Vehicle Type | Running Exhaust Emission Factors (pounds/mile) | | | | |
|---|---|---|---|---|---|
| | ROG | NOx | PM10 | PM2.5 | CO |
| Light duty truck | 0.0004 | 0.0010 | 1.1E-04 | 4.9E-05 | 0.0096 |
| Heavy duty truck | 0.0006 | 0.0207 | 5.0E-04 | 3.4E-04 | 0.0024 |

Note: derived from EMFAC 2011.

PM10 and PM2.5 emission factors include break and tire wear factors.

### Daily Operational Emissions (pounds/day)

**Proposed Project***

| Vehicle Type | Avg Trips/day | miles/trip | ROG | NOx | PM10 | PM2.5 | CO |
|---|---|---|---|---|---|---|---|
| Light duty truck | 22 | 10 | 0.10 | 0.22 | 0.02 | 0.01 | 2.11 |
| Heavy duty truck | 2 | 25 | 0.02 | 0.88 | 0.02 | 0.01 | 0.10 |
| *Total* | *24* | | *0.12* | *1.11* | *0.05* | *0.03* | *2.21* |

Notes: Trips are one-way; assumes 11 employees and 10 truck trips would require 2 trips per day.

Average truck trip length represents from the Santa Clara/San Benito County line (south of Gilroy) down to Seaside.

Daily trip amounts obtained from Bob Holden, MRWPCA, November 2014.

# 1 INTRODUCTION

The Pure Water Monterey Groundwater Replenishment Project is a water supply project that will serve northern Monterey County. The project will provide purified water for recharge of a groundwater basin that serves as drinking water supply, and recycled water to augment the existing Castroville Seawater Intrusion Project's crop irrigation supply. The project is jointly sponsored by the Monterey Regional Water Pollution Control Agency (MRWPCA) and the Monterey Peninsula Water Management District (Water Management District), and also includes participation by the City of Salinas, the Marina Coast Water District, and the Monterey County Water Resources Agency.

The project includes the collection of a variety of new source waters for conveyance to the Regional Wastewater Treatment Plant (Regional Plant) for treatment and recycling. The water will then be used for two primary purposes: replenishment of the Seaside Groundwater Basin and additional recycled water supply for agricultural irrigation in northern Salinas Valley (both described below).

The new source waters would supplement the existing incoming wastewater flows, and would include the following:

1. Water from the City of Salinas agricultural wash water system that currently flows to the Salinas Industrial Wastewater Treatment Facility (Salinas Treatment Facility)
2. Stormwater flows from the southern part of Salinas and the Lake El Estero facility in Monterey,
3. Surface water and agricultural tile drain water that is captured in the Reclamation Ditch and Tembladero Slough, and
4. Surface water and agricultural tile drain water that flows in the Blanco Drain.

Most of these new source waters would be combined within the existing wastewater collection system before arriving at the Regional Plant; water from Blanco Drain would be conveyed on its own directly to the Regional Plant. The combined flow would be treated using the existing Regional Plant processes and then further treated to recycle it for replenishment of the Seaside Groundwater Basin and to provide additional recycled water for agricultural irrigation in the northern Salinas Valley.

HDR, Inc. (HDR) has reviewed the potential effects of the Seaside Groundwater Replenishment Project (GWR Project) on flows in the Salinas River and assessed the potential resulting effects on the river's steelhead population. Results reported by Schaaf & Wheeler Consulting Civil Engineers (Schaaf & Wheeler) on the proposed project's effects on river surface flow show that the GWR Project would reduce the volume of water entering the Salinas River from the vicinity of Davis Road, and potentially reduce Salinas River in-stream flows. Schaaf & Wheeler provided simulated river flows resulting from the each of the diversion scenarios, as well as the baseline condition near Spreckles (USGS Gage 11152500) (RM 13.2), upstream of the Salinas Treatment Facility (RM 11.2). Based on the estimated changes in instream-flow and water quality, HDR, Inc. evaluated potential effects to the Salinas River steelhead population.

## 2 Aquatic Biological Resources

This section describes the aquatic (fishery) resources in the area and potential direct and indirect impacts to those resources resulting from implementation of the diversion actions of the GWR Project.

Aquatic biological resources, including native fish species and federally-listed species, specifically South- Central California Coastal (S-CCC) steelhead (*Oncorhynchus mykiss*) Distinct Population Segment (DPS) is known to occur within and adjacent to areas that could be affected by the Salinas River GWR Project. and tidewater goby (*Eucyclogobius newberryi*), are The following analysis is based on a review of the most current program description, previous biological investigations and reports, and literature from federal, state and local agencies. It provides the existing setting (baseline) and identifies potential adverse effects resulting from implementation of the GWR Project.

## 3 Environmental Setting

The study area includes the immediate project vicinity (i.e., adjacent to the stormwater and Salinas Treatment Facility outflow locations at RM 11.2 and the Blanco Drain confluence with the Salinas River at RM 5.1) and upstream and downstream areas that could be influenced by diversion actions associated with the GWR Project. Areas upstream of the immediate project vicinity that could be influenced by GWR Project diversion actions are the Arroyo Seco (RM 50), San Antonio (RM 105), and Nacimiento (RM 108) rivers. The Salinas River Lagoon is downstream of the immediate project vicinity and could potentially be affected by actions associated with the GWR Project.

Unless otherwise noted, much of the discussion in the Environmental Setting Section, below is provided from MCWRA 2013b.

### 3.0.1 Salinas River Basin

#### 3.0.1.1 *Salinas River*

The Salinas River flows approximately 184 miles north/northwest from its headwaters in the Santa Lucia and La Panza Mountain Ranges in San Luis Obispo County, through the Salinas Valley and reaches the Monterey Bay near Castroville. With a drainage area of approximately 4,240 square miles, the Salinas River watershed is the largest in the central California coast area. Minor tributaries to the Salinas River include Santa Margarita Creek, Trout Creek, Tassajero Creek, Atascadero Creek, Santa Rita Creek, Paso Robles Creek, Jack Creek, Huerhuero Creek, San Juan Creek, and Big Sandy Creek. Major tributaries include the Estrella River, the Nacimiento River, the San Antonio River, San Lorenzo Creek, and the Arroyo Seco River.

The Salinas River is a managed river system, influenced by flow regulation from upstream dams, levees, and land use on the adjacent floodplains. Construction of Nacimiento and San Antonio dams in 1957 and 1965, respectively, altered the natural hydrology of the Salinas River to provide flood protection and aquifer recharge (and recreation, although this was not a primary purpose of the dams) (MCWRA 2001, California Division of Dam Safety 2010). Additionally, the upper 110 mi2 of the Salinas River are controlled by the Santa Margarita Dam

(RM 154, constructed in 1942), which impounds 4,000 acre-feet and forms Santa Margarita Lake (FISHBIO 2011a in MCWRA 2013).

The Salinas River is roughly divided into two reaches based on the channel morphology. The lower 21 miles of river generally has a more narrow channel top width, typically about 500 to 1,000 feet (ft), than the upper 73 miles of river. The Salinas River channel bed and banks are sand dominated along both reaches. The bed-form is usually plane-bed (i.e., relatively flat with little vertical oscillation in the bed topography) or low amplitude dune-ripples. Channel banks are usually well-vegetated, with widely varying amounts of vegetation growing on bars and the channel bottom.

The Salinas River Diversion Facility (SRDF) located at river mile 4.8 is a diversion to supply surface waters to the Castroville Seawater Intrusion Project's non-potable agricultural irrigation system. The SRDF operates April 1-October 31. The dam has pneumatically controlled interlocking steel gates that span the width of the river, the height of the spillway gate is controlled by inflatable bladders (NMS 2007). When in operation the dam will maintain upstream water surface elevation of the impoundment and a total operational storage volume of the impoundment is within 108 acre feet (AF). The SRDF includes a fish passage system with intake screens and fish ladders that comply with National Marine Fisheries Service (NMFS) and California Department of Fish and Wildlife (CDFW) criteria (NMFS 2007).

Non-native species have been spreading pervasively in the Salinas River Watershed. The watershed has an infestation of Arundo donax(Giant reed) which provides little shading in the stream, and can lead to increased water temperatures and reduced habitat quality for aquatic wildlife(MCWRA 2013b).

Habitat conditions in the Lower Salinas River are generally not suitable for steelhead spawning or rearing. The substrate is primarily sand throughout and gravel is only a minor component, primarily upstream of King City. Before Nacimiento and San Antonio Reservoirs were constructed, the Salinas River had little or no flow during most years (NMFS 2007). Even with present operations and release of water from the reservoirs throughout the summer, water temperature is reportedly too high for rearing juveniles (MCWRA 2001 Appendix C). Steelhead populations spawning in the Arroyo Seco or in other tributaries to the Salinas River use the lower Salinas River as a migration corridor only. Low stream flow in the Salinas River may result in areas that are too shallow for fish to pass. Based on an assessment conducted by Dettman (1988), NMFS (2007) reported the Arroyo Seco River had the potential to support an estimated run of a few thousand steelhead.

***Flow Considerations***

Within the Salinas River watershed, the wet season is considered to occur from November- May while the dry season is defined as June-October.

MCWRA (2001) estimated passage flow requirements using field measurement of channel and flow characteristics and the application of objective criteria for conditions suitable for upstream steelhead migration. The study involved development of criteria for passage based procedures developed by Thompson (1972) and CDFW (2012) using water depth transects at critical passage sites. Specifically, the minimum flow for steelhead migration occurs when, at the shallowest cross-sections, there is a depth of at least 0.6 feet across 25% of the channel width and there is a continuous section this deep across at least 10% of the channel width.

Based on the evaluation conducted by MCWRA (2001), a flow of about 72 cubic feet per second (cfs) would meet the minimum migration needs for steelhead in the Lower Salinas River downstream of Spreckels and a flow of 154 cfs would meet the minimum migration criteria upstream of Spreckels. Less flow is required downstream of Spreckels since the channel is narrower and more confined in this reach.

Under some situations the 0.6 foot depth over 25% channel width criteria have been considered to be overly restrictive and less conservative criteria have been applied (USBR 1999 in MCWRA 2001). Using a less restrictive width criterion MCWRA (2001) estimated that passage flows for adult steelhead in the Salinas River would be 94 cfs upstream of Spreckels and 60 cfs downstream of Spreckels (**Table 1**).

**Table 1. Threshold Flows for Maintenance of Steelhead Migration**

| Life stage | Required Flow Depth | Channel Width | Threshold Flow |
|---|---|---|---|
| Adult Immigration | 0.6 feet | 25% of channel | 72 cfs |
| Adult immigration | 0.6 feet | 8 feet (min) | 60 cfs |
| Juvenile and Smolt Emigration | 0.4 feet | 25% of channel | 56 cfs |
| Juvenile and Smolt Emigration | 0.4 feet | 8 feet (min) | 50 cfs |

Flow criteria for downstream migration of post-spawning adults and immature fish have not been widely developed. However, it was assumed by MCWRA (2001) that post-spawning adult steelhead and emigrating juvenile steelhead can migrate downstream over riffle areas at shallower depths than those needed by adults migrating upstream. If a depth criterion of 0.4 feet is substituted in the analysis of passage transects in the Salinas River the resulting minimum passage flow estimates for downstream migration of post-spawning adults and smolts would be 112 cfs upstream of Spreckels and 56 cfs downstream of Spreckels (MCWRA 2001). If it is also assumed that the 0.4 foot depth criteria were achieved over a continuous 8 foot channel width rather than 10% of the channel width, the minimum passage flow estimate would be further reduced to 59 cfs upstream of Spreckels and 50 cfs downstream of Spreckels (MCWRA 2001).

In addition to flow considerations provided by MCWRA (2001), NMFS (2007) set up guidelines regarding steelhead upstream and downstream migration as permit conditions associated with operating the Salinas River Diversion Facility (SRDF). Adult steelhead upstream migration triggers will be in effect from February 1 through March 31 (NMFS 2007). When flow triggers occur, flows of 260 cfs at the USGS gage near Chualar (USGS gage 11152300) will be provided to facilitate adult steelhead upstream migration of adult steelhead. To insure this minimum flow and duration, MCWRA will provide reservoir releases when necessary to augment natural flows. The number of passage days targeted for dry-normal, normal-normal, and wet-normal years are 16, 47, and 73 days, respectively (NMFS 2007).

Based on specific flow triggers that consider reservoir storage, flow, and hydrologic conditions NMFS (2007) further recommended flows to facilitate the downstream migration of smolts and rearing juvenile steelhead in the Salinas River. In some years, flow releases for smolt migration may not occur because triggers for those releases are not met. However, in those years, NMFS (2007) required MCWRA to provide reservoir releases and SRDF bypass flows to enhance migration opportunities for juvenile steelhead and post-spawn adult steelhead (kelts) (NMFS 2007).

In April 2010 the MCWRA began operation of the SRDF as part of the Salinas Valley Water Project (SVWP) (MCWRA 2011). Operation of the SRDF involves release of water from Nacimiento Reservoir to the Salinas River throughout the irrigation season with impoundment and diversion at the SRDF located at about river mile 4.8 near the upper part of the Salinas River Lagoon (MCWRA 2011). The SRDF operates seasonally between April 1 and October 31. Beginning April 1, MCWRA provides bypass flows to the lagoon under the following circumstances. For dry year-types, MCWRA provides 2 cfs to the lagoon when the SRDF is operating or during aquifer conservation releases. For non-dry year-types, and if the combined reservoir storage is 220,000 AF or more, MCWRA provides additional supplemental bypass flows (MCWRA 2011). If the lagoon is open to the ocean, then MCWRA provides 45 cfs to the lagoon for 10 days or until the lagoon closes to the ocean, whichever occurs first, then 15 cfs to the lagoon through June 30th, then 2 cfs as long as the SRDF is operating or during aquifer conservation releases (MCWRA 2011). If the lagoon is not open to the ocean, then MCWRA will provide 15 cfs to the lagoon through June 30th, then 2 cfs as long as the SRDF is operating or during aquifer conservation releases. These bypass flows influence water quality conditions in the lagoon during the dry season. Previous to implementation of the SVWP there was no requirement for provision of flow to the lagoon and there was generally no flow to the lagoon after storm flows ceased in the spring. This was likely consistent with natural river flow patterns before development of the Salinas Valley for agriculture (MCWRA 2011).

***Temperature Considerations***

Water temperature is measured at two locations in the Salinas River, at the Blanco Road Bridge, three miles upstream of the SRDF, and at the SRDF. Data collected during 2011 indicate that the general trend within the monitoring period showed increasing water temperatures from spring to summer and decreasing temperatures from summer to fall. Sullivan et al. (2000) was reported in RWQCB (2008) as stating that for the protection of steelhead, the maximum weekly average temperatures are 67 °F. Temperatures recorded at the Spreckels Gage range from 50 to 82 °F, with an average of 63 °F (RWQCB 2008).

Water temperatures in this stream are highly variable and dependent on reservoir releases, air temperature, and reservoir storage. In general, water released through the reservoir outlet is at a relatively constant temperature of 52°F to 54°F (NMFS 2001). The water warms rapidly as it moves downstream, generally in proportion to fluctuation in daily air temperature. At minimum release levels (25 to 30 cfs), water temperature can increase to as much as 73°F within 5 miles of the Nacimiento dam, and 75°F within 10 miles of the dam. During the summer conservation release period (with flows of 300 cfs or more), water temperature is generally maintained at less than 64°F within 5 miles of the dam, and 68°F or less within 10 miles of the dam (MCWRA 2001).

In addition, diurnal water temperature fluctuations are common. Data collected at the Chualar gage indicate an average difference of 4.5°F and a maximum difference of 8°F between maximum and minimum daily temperature in April (MCWRA 2001). In May there is as much as a 22°F daily swing in temperature and the average change is 16°F (MCWRA 2001).

***City of Salinas Wastewater Facility***

Three miles southwest of the City of Salinas, the Salinas Industrial Wastewater Treatment Facility (Salinas Treatment Facility) is located on the bank of the Salinas River. The City of Salinas owns and operates the plant to treat and dispose of water used to wash and prepare vegetable crops at 24 industrial food processing facilities in Salinas. The Salinas Treatment Facility consists of an aeration pond for treatment of incoming water and three large percolation ponds that dispose of water by percolation and evaporation. Additional disposal capacity during the high-inflow season (May-October) is provided by drying beds and by temporary Rapid Infiltration Basins (RIBs) between the main ponds and the adjacent Salinas River channel.

Water that percolates from the ponds either flows a short distance through the subsurface and emerges as seepage into the Salinas River or accrues to the regionally extensive shallow aquifer. The shallow aquifer is not used directly as a source of water supply, but downward percolation from the shallow aquifer is a source of recharge to the 180-Foot aquifer, which is used for water supply in the agricultural area surrounding the Salinas Treatment Facility.

#### 3.0.1.2 *Salinas River Lagoon*

The mouth of the river is a seasonal lagoon controlled by the presence of a sandbar that forms in response to changes in outflow and tidal cycles. Lagoons form in response to seasonal rainfall and water patterns, and tidal influences, with sandbar closure during dry periods (spring and summer) and breaching during wet periods (fall and winter). During wet months, high energy waves erode and breach sandbars, while high stream flows widen and deepen the estuary mouth (Capelli 1997, Smith 1990 in MCWRA 2013b). In dry months, low energy waves deposit sand and build up sandbars. After sandbar formation, water surface elevation rises as the impounded lagoon fills with freshwater streamflow. The fresh water interacts with already present salt water, occasional surf wash, and salt water that has percolated through the sandbar to create a brackish environment or even a freshwater environment if inflow is sufficient (Capelli 1997, Smith 1990 in MCWRA 2013b). Sandbars generally breach at the onset of fall and winter storms, converting the estuaries to freshwater during high flows and brackish estuaries during low inflows if there is still a substantial area of impounded water despite removal of all or most of the sandbar. In the Salinas River flooding of agricultural lands can precede the natural breaching (MCWRA 2013b).

In general, estuaries provide important habitat for juvenile steelhead and are used for rearing/feeding, freshwater to saltwater acclimation, and migration (Simenstad et al. 1982). Similarly, lagoons located at the interface of river mouths and the ocean may be a valuable habitat component for juvenile steelhead, providing abundant feeding opportunities for rearing fish and saltwater transition zones for outmigrating smolts. Preferred rearing conditions in lagoons exist when sandbars cut off ocean access which reduces salinity and promotes mixing of the lagoon water (Smith 1990), which prevents water stratification and high temperatures, thus supporting food production and appropriate dissolved oxygen concentrations.

Historical information (i.e., late 1800s) reported by the Habitat Restoration Group et al. (1992 in NMFS 2007) indicates that the floodplain adjacent to the Salinas River and the lagoon appeared to support extensive areas of wetland-type vegetation, with riparian woodland vegetation bordering the channel in the vicinity of the present river mouth. This freshwater marsh ecosystem, including the lower Salinas River was likely an integral component of a larger wetland complex that included Elkhorn Slough and the Pajaro River mouth (NMFS 2007).Currently, the Salinas Lagoon is around 2 miles long and located in low-lying, open agriculture setting (Casagrande et al. 2003). The banks are defined leading to a stable surface area during the summer months. The northern bank is vegetated with riparian and phreatophytic vegetation with large woody debris scattered around the lagoon (Casagrande et al. 2003). A seasonal sandbar forms in the lagoon in response to the changes in outflow and tidal cycles (MCWRA 2011) and currently is reported to be utilized primarily as a migration corridor by adult and juvenile steelhead (MCWRA 2013b).

The lagoon supports a mixture of marine and freshwater fishes. Over 24 species (**Table 2**) were observed during lagoon fishery surveys conducted during the past 12 years (2002-2013). Some species appear to occur in the lagoon year round while others are seasonally present. (HES 2012, MCWRA 2013a). Steelhead and tidewater goby have been rarely observed in the lagoon surveys. Only three steelhead were observed: two in 2011 and one in 2013. Tidewater goby were recently observed for the first time during the 12 years of the lagoon survey and for the first time since 1951, when two gobies were observed during fall 2013 surveys. The tidewater goby was presumed lost from the lagoon due to levee construction and channelization (USFWS 2013). It is likely that the gobies observed in 2013 had dispersed from nearby Bennett Slough or Moro Cojo Slough (MCWRA 2013b).

**Table 2. Fish species observed in Salinas River Lagoon during lagoon fishery surveys conducted during spring, summer and fall (2002-2013)**

| Species | Scientific name | Season observed | | |
|---|---|---|---|---|
| | | Spring | Summer | Fall |
| Arrow goby | *Clevelandia ios* | No | No | Yes |
| Carp | *Cyprinus carpio* | No | Yes | Yes |
| Chinook Salmon | *Oncorhynchus tshawystcha* | No | No | Yes |
| Hitch | *Lavinia exilicauda* | No | Yes | x |
| Largemouth bass | *Micropterus salmoides* | No | Yes | Yes |
| Mosquitofish | *Gambusia affinis* | No | Yes | Yes |
| Pacific herring | *Clupea pallasii* | No | Yes | Yes |
| Pacific lamprey | *Lampetra tridentata* | Yes | No | Yes |
| Pacific sardine | *Sardinops sagax* | No | Yes | No |
| Pacific staghorn sculpin | *Leptocottus armatus* | Yes | Yes | Yes |
| Prickly sculpin | *Cottus asper* | Yes | Yes | Yes |
| Rockfish | *Sebastoides spps* | No | Yes | No |

| | | | | |
|---|---|---|---|---|
| Sacramento blackfish | *Orthodon microlepidotus* | Yes | Yes | Yes |
| Sacramento pikeminnow | *Ptychocheilus grandis* | Yes | Yes | Yes |
| Sacramento sucker | *Catostomus occidentalis* | Yes | Yes | Yes |
| Shiner surfperch | *Cymatogaster aggregata* | Yes | Yes | Yes |
| Starry flounder | *Platichthys stellatus* | Yes | Yes | Yes |
| Steelhead | *Oncorhynchus mykiss* | Yes | Yes | Yes |
| Striped bass | *Morone saxatilis* | Yes | Yes | Yes |
| Threadfin shad | *Dorosoma patenense* | Yes | No | Yes |
| Threespine stickleback | *Gasterosteus aculeatus* | Yes | Yes | Yes |
| Tidewater goby | *Eucyclogobius newberryi* | No | No | Yes |
| Topsmelt | *Atherinops affinis* | No | Yes | Yes |
| Yellowfin goby | *Acanthogobius flavimanus* | Yes | Yes | No |

The lagoon is brackish in the fall due to the freshwater from the inflowing river and salt water form the high ocean waves (Casagrande et al. 2003). During major runoff events, water elevations in the lagoons rise and breaching events occur. During breaching events, which can be natural or artificial, anadromous fish such as steelhead and Pacific lamprey are able to migrate into the river (Casagrande et al. 2003). The Monterey County Water Resources Agency intervenes in the breaching of Salinas Lagoon as needed to prevent flooding of nearby properties ~~each year~~ by using equipment to either cause or assist the breach (Casagrande et al. 2003). The MCWRA also manages the lagoon water levels as part of flood control activities (MCWRA 2011).

Monterey County Water Resources Agency intermittently evaluates water quality of the lagoons and analyzes fish population and response to any changing conditions. Since 2002 MCWRA has conducted the Lagoon Monitoring Program, which in 2010 was modified to be consistent with the NMFS 2009 Biological Opinion for sandbar management at the mouth of the Salinas River. Fall sampling was expanded to include spring and summer surveys.

***Flow Considerations***

Water levels in the lagoon are monitored by a county gage and staff plate located at the Old Salinas River outlet gate, which is located in the northwestern corner of the lagoon (Casagrande et al. 2003). During non-event periods the majority of fresh or brackish water entering the lagoon comes from the Blanco Drain, located 8 km upstream from the lagoon, which is an agricultural runoff canal (Casagrande et al. 2003). There are also a number of small agricultural tile drainage systems discharging directly into the lagoon. The flow at which the Salinas River lagoon will remain open to the ocean is expected to generally range from 80 to 150 cfs (MCWRA 2005).

#### 3.0.1.3 *Arroyo Seco River*

The Arroyo Seco River enters the Salinas River at RM 50, and drains a watershed area of 303 mi2. The river extends approximately 37 miles from it is headwaters within forest and wilderness area to its confluence with the Salinas River. The river is unregulated with surface flow interrupted during dry summer months as it flows across the Salinas Valley en route to the

Salinas River. The Arroyo Seco River contains a majority of the steelhead spawning habitat and half the steelhead rearing habitat within the Salinas River basin. It is the closest major tributary to the Pacific Ocean, which increases the likelihood of steelhead utilization over upstream tributaries (MCWRA 2013b).

#### 3.0.1.4 *San Antonio River*

The San Antonio River enters the Salinas River at RM 105 and drains 344 mi2. The river flows 58 miles from its headwaters in the Los Padres National Forest to the Salinas River. The San Antonio River is regulated by the San Antonio Dam (RM 5), which impounds <u>335,000</u> ~~350,000~~ acre-feet. The dam was constructed in 1965 and is used for flood protection, aquifer recharge, and recreation. Prior to construction of San Antonio Dam, the San Antonio River normally did not reach the Salinas River in late summer (Monterey County Flood and Water Conservation District, 1989, as cited in MCWRA 2001). Flow prescriptions are used to maintain steelhead rearing habitat on the San Antonio River below the dam. Prior to construction of the San Antonio Dam, the San Antonio River normally did not reach the Salinas River in late summer. Aquatic habitat below the dam consists primarily of shallow-run habitat, and lesser amounts of pool and riffle habitat. The channel substrate is primarily composed of equal parts of sand and gravel with lesser amounts of cobble and silt (Nacitone Watersheds Steering Committee and Central Coast Salmon Enhancement, Inc., 2008).

#### 3.0.1.5 *Nacimiento River*

The Nacimiento River enters the Salinas River at RM 108 and drains 362 mi2. The river flows 53 miles from its headwaters in the Santa Lucia Mountains within the Los Padres National Forest to the confluence with the Salinas River. Under natural conditions, flow in the river is intermittent, drying during the summer months. The river is regulated by the Nacimiento Dam, located 10 miles upstream from the confluence with the Salinas River. The dam, constructed in 1957 impounds 350,000 acre-feet, and provides flood protection and aquifer recharge to the Salinas Valley (MCWRA 2001). Before Nacimiento Reservoir was constructed, the Nacimiento River regularly experienced levels of little or no flow in the reach currently inundated by the reservoir and in the section of river downstream of the dam (MCWRA 2001). The dam also blocks passage of steelhead to the upper portion of the basin. Dam operation and flow releases on the Nacimiento River are managed to facilitate and enhance passage for upstream migrating adult steelhead on the Salinas River, to facilitate and enhance passage for downstream migrating steelhead smolts and juveniles on the Salinas River, to maintain the Salinas River Lagoon, to provide water for Salinas River Diversion Facility (RM 4.8) and to maintain steelhead rearing habitat below the dam (MCWRA 2005). Below the dam, the Nacimiento River is characterized by a low gradient and long, wide sections with sparse riparian vegetation. Typical substrate consists of gravel with lesser amounts of sand and cobble. Water temperatures below the dam generally range from 64-69 °F, but can reach as high as 73-75°F (MCWRA 2013b).

#### 3.0.1.6 *Salinas Valley Water Project*

The Salinas Valley Water Project (SVWP) was completed in 2010 with the goals to halt seawater intrusion to aquifers, to provide water for current and future needs, and to improve the hydrologic balance of groundwater within the basin. Groundwater is the source for most urban and agricultural water needs in the Salinas River Valley (NMFS 2007). A long-known and continual imbalance between groundwater withdrawal and recharge caused overdraft conditions and seawater intrusion into the aquifer. To address (in part) overdraft in the basin, the San Antonio and Nacimiento reservoirs were constructed in 1965 and 1957, (NMFS 2007).

The SVWP is a combination of structural and operational changes to provide surface water deliveries and aquifer replenishment. The project includes the Salinas River Diversion Facility (SRDF) located at RM 4.8 on the Salinas River, which consists of a bladder dam to impound spring, summer and early-fall reservoir releases, and a pump station to deliver surface water and reduce the need for groundwater pumping. The SVWP also includes re-operation of the San Antonio and Nacimiento dam releases as the source of surface water. The project does not provide new water sources for the basin, rather more water is released from the San Antonio and Nacimiento dams in the spring, summer, and early-fall for diversion by the SRDF to offset groundwater pumping (NMFS 2007).

As part of the SVWP goals and to minimize impacts to federally threatened S-CCC steelhead and its Critical Habitat, the MCWRA developed flow prescriptions to facilitate and enhance adult steelhead upstream migration, downstream migration of juveniles, smolts, and kelts (post-spawn adult steelhead), and spawning and rearing habitat within the San Antonio and Nacimiento rivers below the dams (MCWRA 2005). Additionally, MCWRA releases lagoon maintenance flows in conjunction with lagoon opening and closure, juvenile passage flows released from the San Antonio and Nacimiento dams, and passage conditions within the Arroyo Seco River (MCWRA 2005). The flow prescriptions and timing are tied to the S-CCC steelhead life cycle within the Salinas River (MCWRA 2005).

### 3.0.2 Species Evaluated

#### 3.0.2.1 *Native Species*

Snyder (1913) described 12 fish species within the Salinas River basin including steelhead, Pacific lamprey (*Lampetra tridentata,* new *Entosphenus tridentatus*), threespine stickleback (*Gasterosteus aculeatus*), coast range sculpin (*Cottus aleuticus*), hitch (*Lavinia exilicauda*), Sacramento pikeminnow (*Ptychocheilus grandis*), prickly sculpin (*Cottus asper*), riffle sculpin (*Cottus gulosus*) , Sacramento sucker (*Catostomus occidentalis*), Monterey roach (*Hesperoleucus symmerticus*, new *Lavinia symmetricus subditus*), tule perch (*Hysterocarpus traski*), and speckled dace (*Rhinichthys osculus*). MCWRA (2001) reported that 8 of the species recorded by Snyder (1913), including tule perch, riffle sculpin, and coast range sculpin, were not collected. Moyle (2002) believes that the riffle sculpin may have been misidentified and that the roach collected is a Monterey Roach subspecies (*Lavinia symmetricus subditusi*).

Casagrande et al. (2003) described the Sucker-Hardhead-Pikeminnow Assemblage as occurring in large rivers, reservoirs, with warm temperatures, and along sand or bedrock substrate, such as occurs in the lower Salinas River. Hitch, Monterey roach, and non-native species including redear sunfish and green sunfish, bluegill and black bass can also be found within this assemblage (Casagrande et al. 2003). This fish assemblage occurs in the low-elevation reaches of the western and north Salinas River watershed, including the Salinas River main-stem, the lower reaches of the Arroyo Seco River and lower Gabilan Creek (MCWRA 2013a). The Roach assemblage is associated with small tributary streams with low to moderate gradients and rocky substrate, and the Rainbow Trout-Speckled Dace Assemblage, which typically occurs in cool headwater streams are also represented within the Salinas River watershed. The most abundant native fishes observed in the Salinas River watershed during recent years include hitch, Sacramento blackfish, speckled dace, starry flounder, and threespine stickleback (MCWRA 2011). FISHBIO (2011). **Table 3** lists native fish species known to occur in the Salinas River watershed.

**Table 3. Native Fish Species Known to Occur in the Salinas River Watershed (Source MCWRA 2013b)**

| Common name | Scientific name | Special Status | Distribution |
|---|---|---|---|
| Hitch | *Lavinia exilicauda* | None | Mainstem Salinas |
| Monterey roach | *Lavinia symmetricus subditus* | California Species of Special Concern | Mainstem Salinas tributaries |
| Pacific herring | *Clupea pallasi* | None | Salinas Lagoon |
| Pacific lamprey | *Entosphenus tridentatus* | None | Mainstem Salinas tributaries |
| Prickly sculpin | *Cottus asper* | None | Mainstem Salinas, tributaries |
| Sacramento blackfish | *Orthodon microlepidotus* | None | Mainstem Salinas |
| Sacramento pikeminnow | *Ptychocheilus grandis* | None | Mainstem Salinas |
| Sacramento sucker | *Catostomus occidentalis* | None | Mainstem, Salinas/Reservoir |
| Shiner surfperch | *Cymatogaster aggregata* | None | Salinas Lagoon |
| Speckled dace | *Rhinichthys osculus* | None | Upper tributaries |
| Staghorn sculpin | *Leptocottus armatus* | None | Salinas Lagoon |
| Starry flounder | *Platichthys stellatus* | None | Salinas Lagoon |
| South Central California Coast steelhead | *Oncorhynchus mykiss* | Federally-listed Threatened | Mainstem Salinas tributaries |
| threespine stickleback | *Gasterosteus aculeatus* | None | Mainstem Salinas tributaries |
| Tidewater Goby | *Eucyclogobius newberryi* | Federally Endangered. | Salinas Lagoon |
| topsmelt | *Atherinops affinis* | None | Salinas Lagoon |

#### 3.0.2.2 *Special Status Species*

**Table 3** also lists the special status species in the Salinas River and Salinas Lagoon. Of the species identified as occurring within the Salinas River and could be affected by ongoing operations and subject to regulation by NMFS or USFWS, SCCC steelhead and tidewater goby were identified as occurring in the Salinas River and are the only listed species addressed in this Analysis. Monterey roach is a special status species identified by CDFW as a Species of Special Concern and is also addressed in this Analysis.

### 3.0.3 Species Considered and Eliminated from the Analysis

In 2011, Skiles et al. (2013) reported pink salmon (*O. gorbuscha*) in the Salinas River. Although pink salmon were historically distributed in coastal streams, the Puget Sound region is regarded as the southernmost extent of recent spawning habitat. Pink Salmon have been known to occur within California (Jordan and Evermann 1896, Moyle 2002, Moyle et al. 2008) and have even been reported south of the San Francisco Bay in the San Lorenzo River (Scofield 1916). However, the four pink salmon do not suggest a population within Salinas River (Skiles et al. 2013). Therefore, the species is not considered further in this analysis.

### 3.0.4 Special Species Status Species

#### 3.0.4.1 *South-Central California Coastal Steelhead Distinct Population Segment*

***ESA Listing Status***

In 1996, NMFS and USFWS adopted a joint policy for recognizing Distinct Population Segments (DPS) under the Endangered Species Act (ESA) (DPS Policy; 61 FR 4722; February 7, 1996). On August 9, 1996, NMFS identified 15 Evolutionarily Significant Units (ESU), with the South-Central California Coast (SCCC) steelhead ESU listed as a threatened species (62 FR 43937). During 2006 the SCCC steelhead status as Threatened was re-affirmed (71 FR 834).

The SCCC DPS includes all naturally spawned anadromous populations of *O. mykiss* in coastal river basins from the Pajaro River in Monterey County southward to but not including the Santa Maria River in San Luis Obispo County (65 FR 36074, 71 FR 834).

The ESA requires that NMFS review the status of listed species under its authority at least every five years and determine whether any species should be removed from the list or have its listing status changed. In September 2012, NMFS completed a 5-year status review of the SCCC steelhead DPS. Based upon a review of available information, NMFS (2012) recommended that the SCCC steelhead DPS remain classified as a threatened species.

Although *O. mykiss* exhibits both resident and anadromous life history characteristics, the SCCC steelhead DPS includes only the anadromous life form of *O. mykiss*.

***Critical Habitat Designation***

Critical Habitat for SCCC steelhead was designated in February 2000 (65 FR 7764) and was reaffirmed in 2005 (70 FR 52488). Section 3 of the ESA (16 U.S.C. 1532(5)) defines critical habitat as ‘‘(i) the specific areas within the geographical area occupied by the species, at the time it is listed on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protection; and (ii) specific areas outside the geographical area occupied by the species at the time it is listed”. The freshwater primary constituent elements of critical habitat include: 1) spawning habitat, including spawning substrate, and adequate water quantity and quality; 2) freshwater rearing habitat including floodplain connectivity, and natural escape and velocity cover; and 3) freshwater migration corridors free of obstructions, with water quantity and quality conditions that allow movement (NMFS 2005, MCWRA 2013b).

Critical Habitat on the Salinas River watershed is designated from the mouth upstream to 7.5 miles below the Santa Margarita Lake, Arroyo Seco River, Nacimiento River (below the dam), San Antonio River (below the dam), and the upper Salinas River tributaries (NMFS 2005, MCWRA 2013b). The primary constituent element of critical habitat that could potentially be affected by the Proposed Project includes migration habitat in the Salinas River.

### *Taxonomy*

The taxonomic history and nomenclature of steelhead is complex and difficult to reconcile. The species has been described with at least 22 scientific names in five genera and is known by many common or colloquial names (Scott and Crossman 1973; Healey and Jordan 1982). Until 1989, the primary scientific name used for steelhead from western North America was *Salmo gairdneri*. However, Smith and Stearley (1989) presented evidence that Salmo gairdneri was the same species as the previously described Salmo mykiss, and was more similar to Pacific salmon (*Oncorhynchus*) than to Atlantic salmon (*Salmo*). Thus, the scientific name *Oncorhynchus mykiss* was adopted for steelhead and rainbow trout in 1989.

Based on genetic and distributional information, Boughton et al. (2006) identified 41 historically independent populations of SCC steelhead in the DPS, including three populations in the Salinas River (Moyle 2008). Three populations are recognized in the Salinas River due to its large size, which likely allows sufficient geographic isolation to maintain multiple populations (Boughton et al. 2006). These 41 populations are divided into four biogeographical regions including (from north to south): Interior coast range, Carmel Basin, Big Sur Coast, and San Luis Obispo Terrace (Boughton et al. 2007 as cited in Moyle 2008). The Salinas River occurs within the Interior Coast Range Biogeographic Population Group (BPG; NMFS 2012 in MCWRA 2013).

### *Population Trends*

The limited documentation on current abundance suggests the overall population in the SCCC steelhead DPS is extremely small. Estimating the magnitude of the departure of the population from historical conditions is further hampered because the run size for most watersheds continues to be poorly characterized and major impacts leading to subsequent declines occurred prior to most modern fish investigations in the SCCC steelhead DPS. The sporadic presence of steelhead in many watersheds in the SCCC steelhead DPS further confounds assessment efforts. Nonetheless, investigations conducted since 1996 (Busby et al. 1996, Boughton et al 2006) indicate that of the 39 watersheds that historically supported anadromous runs, virtually all continue to be occupied by native O. mykiss, though most of the populations are at historically low levels(NMFS 2013).

Recent status reviews conducted by Busby (1996), Good et al. (2005), and Williams et al. (2011) indicated that steelhead populations in the region declined dramatically from the 27,000 estimated at the turn of the century.

### *Life History Overview*

Much of the following discussion is derived from MCWRA 2013b.

Steelhead are a form of rainbow trout that migrate to the ocean as juveniles and return to inland waters as adults to spawn in a process known as anadromy. All steelhead within the SCCC steelhead DPS are considered "winter steelhead" based on their migratory timing and behavior; ascending streams during the winter when winter rainfall results in suitable flow and temperature (Busby 1996, Moyle 2002). SCCC steelhead require pools with low velocities in association with instream and near stream cover such as large woody debris, undercut banks, or submerged or overhanging vegetation, can provide desirable resting areas for migrating adult steelhead. The migration of adult SCCC steelhead is strongly associated with high winter and spring flows that provide a continuous hydrological connection between the ocean and upstream habitat (NMFS 2012). The pulse of upstream migration is believed to coincide during storm runoff conditions when flows are elevated. Adult upstream migration times vary according to life history type (e.g., winter run versus spring-run) and climatic conditions (i.e., the timing of higher winter and spring flows) (MCWRA 2013b).

Winter steelhead fish are reported to enter freshwater to spawn between November 1 and April 30 (Barnhart 1986), with peak numbers occurring in January and February (Moyle 2002). NMFS (2007) states that SCCC steelhead primarily migrate from December through April in the Salinas Region. Steelhead spawn in cool, clear, well-oxygenated streams with suitable depth, current velocity, and gravel size (Reiser and Bjornn 1979, Barnhart 1986). Steelhead typically select spawning areas at the downstream end of pools, in gravels ranging from approximately 0.5 to 4.5 inches in diameter (Pauley et al. 1986). Once they reach their spawning grounds, females use their caudal fin to excavate a nest (redd) in streambed gravels where they deposit their eggs. Steelhead are unique among Pacific salmonids in that they can be iteroparous (may be able to return the ocean and then spawn again in one or more subsequent years). Eggs incubate for 25–30 days, depending on water temperatures (warmer temperature will decrease incubation time, which is reported to occur in the Salinas River watershed), then hatch into alevins (larval stage). The alevins remain in the gravel for an additional 2–5 weeks after hatching, depending on temperature, before emerging in spring or early summer as fry (Shapovalov and Taft 1954, Barnhart 1986). Following emergence, steelhead juveniles (fry) feed in shallow, low-velocity areas such as stream margins and low-gradient riffles, then move to faster, deeper water as they increase in size (Bjorkstedt et al. 2005). In the summer and late-fall, as flows lessen and riffle area decreases, juvenile steelhead may move into pools (Barnhart 1986). During winter as water temperatures decrease and flows increase, juveniles seek hydraulic refuge within pools, interstitial spaces in cobble and boulder substrates, or near large woody debris (MCWRA 2013b).

As fry grow they develop marks on their sides and become known as "parr", which is the juvenile life stage (Moyle, 2002). After 1 to 3 years of rearing in freshwater, most juvenile steelhead begin the process of smoltification and proceed to migrate downstream toward the ocean. Young steelhead feed on a wide variety of aquatic and terrestrial insects, and emerging fry are sometimes preyed upon by older juveniles (NMFS 2007). Steelhead smolts may immigrate to the ocean from January through June on the receding limb of the winter hydrograph. NMFS (2012) states that outmigration usually occurs in the late winter and spring. These fish may reside in the ocean for between 2 and 4 years (Barnhart 1986; Moyle 2002) prior to returning to spawn. Habitat needs in the Salinas River for emigrating steelhead (smolts) likely are similar to those for rearing juvenile steelhead. Migrating smolts are particularly vulnerable to predation, and physical structure and cover (refugia) are important for survival of this life stage. Similar to rearing juveniles, outmigrants rely on the presence of adequate food and suitable resting pools. Lagoons and estuaries at the river mouth are often very important for the rearing of larger juveniles and may provide essential feeding opportunities for smolts prior to entering the ocean (Smith 1990, MCWRA 2013b).

Densities of juvenile steelhead in streams are greatest where in-stream cover and their invertebrate food source are diverse and abundant. The distribution and abundance of rearing juveniles is influenced by food availability, predation and competition, and the quantity and quality of suitable habitat (Bjornn and Reiser 1991). Temperature is also an important factor for juvenile rearing conditions. In general, water temperatures less than 59°F are suitable for summer rearing of juvenile steelhead, while temperatures greater than 77°F are potentially lethal, and temperatures above 72°F may affect feeding and fitness (Bjornn and Reiser 1991, NMFS 2011, MCWRA 2013b).

Downstream migrating steelhead exhibit three possible life history strategies based upon usage of lagoon and stream rearing habitat: stream rearing, lagoon rearing, and combination stream and lagoon rearing (Hayes et al 2008). Stream-reared steelhead spend one–three years in the stream, and then migrate to the ocean with minimal lagoon residence. Lagoon-reared steelhead spend only a few months in the stream before migrating to the lagoon where they will rear for typically one year. The combination stream and lagoon strategy will rear for 1–2 years in the stream and 1–10 months in the lagoon before immigrating to the ocean. Conditions for growth can be very good in lagoons relative to stream habitat, and thus fish in lagoons tend to achieve a larger size-at-age then their stream-reared counterparts (Smith 1990, Hayes et al. 2008). Since larger smolts tend to have higher ocean survival, growth during lagoon rearing may increase ocean survival of steelhead smolts (MCWRA 2013b).

***Steelhead Habitat in the Salinas River***

Much of the following discussion is derived from MCWRA 2013b.

The mainstem Salinas River is a migration corridor for adult steelhead migrating from the ocean to spawn in tributaries (NMFS 2007). Kelts, smolts, and juveniles use the river to migrate downstream to the ocean or lagoon. The lower Salinas River has a sandy substrate with a broad channel with no spawning or rearing habitat present, (NMFS 2003). Most spawning and rearing that does occur in the Salinas River Basin occurs in tributary streams (NMFS 2003, NMFS 2007). The Salinas River between the confluence with the Pacific Ocean and below the upstream dams is characteristic of a depositional environment where transverse, lateral, and point bars form the predominant channel pattern. The substrate is primarily sand throughout, and coarser gravel is only a minor component, primarily upstream of King City. Before Nacimiento and San Antonio Reservoirs were constructed, the Salinas River had little or no summertime flow in most years due to groundwater pumping (NMFS 2003). Even with present operations and release of cooler water from the reservoirs throughout the summer, water temperatures are too high for rearing juveniles (MCWRA 2001 Appendix C). As such, steelhead use of upper Salinas River tributaries depends upon maintaining a migration corridor in the mainstem Salinas River. The current migration corridor of the lower Salinas River is limited by the availability of adequate flows to provide passage over long distances to suitable spawning and rearing habitat (NMFS 2007). Adequate migration flows are highly annually variable. Groundwater pumping has also affected these flows, and levees, channel maintenance, road crossings, and removal of riparian vegetation have reduced the availability and quality of migration habitat for steelhead (NMFS 2007, MCWRA 2013b).

### *Steelhead in the Salinas River Lagoon*

Habitat conditions in the Salinas River Lagoon are generally not suitable for steelhead spawning or egg incubation, but could potentially support rearing. When the river mouth is open, the lagoon is tidally influenced and sustains saltwater conditions. When the river mouth is closed, the lagoon is typically fresh with good water quality conditions, specifically when Salinas River inflow is adequate and no saltwater intrusions occur. The transition period between saltwater and freshwater conditions may result in salinity stratification that can contribute to elevated temperatures and low dissolved oxygen levels, conditions not suitable for rearing juveniles. Thus, the lagoon is believed to be utilized primarily as a migration corridor by adult and juvenile steelhead.

### *Current and Ongoing Studies in the Salinas River Watershed*

MCWRA has conducted fisheries studies on the Salinas River Watershed including the Nacimiento, Arroyo Seco, and Salinas Rivers and the Salinas River Lagoon (MCWRA 2011, 2012, 2013a). Studies focused primarily on these tributaries to the Salinas River because the tributaries historically provided the best spawning and rearing habitats in the watershed. Additionally, MCWRA (2011, 2012) measured conductivity, dissolved oxygen, and water temperature on the Salinas River and Lagoon and conducted an impoundment survey at the SRDF.

During 2010 MCWRA developed and implemented a Juvenile Outmigration Monitoring Program to: (1) determine the abundance of downstream migrating steelhead smolts in the Salinas River Basin; (2) determine the relative contribution of the tributaries on smolt abundances to the overall Salinas River Basin abundance; (3) characterize the migration timing of steelhead smolts; and (4) evaluate potential relationships to environmental factors. A set of three rotary screw traps (RST) was installed and operated in the Salinas River Watershed at three locations, one each on the Arroyo Seco River, Nacimiento River and Salinas River. Sampling was conducted from March 12 through May 28 during 2010 (MCWRA 2011) and during the same time period in 2011 (MCWRA 2012)

During the November 16, 2010 impoundment survey, no *O. mykiss* were observed (MCWRA 2011). However, electrofishing and seining surveys conducted on the Nacimiento and Arroyo Seco rivers during 2010 resulted in capture of *O. mykiss* on the Arroyo Seco River (MCWRA 2011). During the 2010 juvenile outmigration survey period, a total of 140 *O. mykiss* were captured in the Arroyo Seco River, which led to an abundance estimate of 480 juvenile *O. mykiss*. No *O. mykiss* were captured in the Nacimiento River and only two *O. mykiss* were captured on the Salinas River, so no abundance estimates could be generated (MCWRA 2011).

The impoundment survey was also conducted during 2011, but was not completed due to unforeseen environmental conditions not allowing efficient sampling to occur (MCWRA 2012). Electrofishing and seining was also conducted during 2011 in the Nacimiento and Arroyo Seco rivers. Twenty eight *O. mykiss* were captured in the Arroyo Seco River and no *O. mykiss* were captured in the Nacimiento River. The Salinas Basin Juvenile *O. mykiss* Outmigration Monitoring report published in September 2011 (Appendix A of MCWRA 2012) documented the second year of outmigration monitoring in the Salinas River watershed. A total of 64 *O.*

*mykiss* were captured in the Arroyo Seco River, resulting in an abundance estimate of 332 *O. mykiss* for the sampling season. No *O. mykiss* were captured in the Nacimiento River and only two *O. mykiss* were captured on the Salinas River, so no abundance estimates could be generated (MCWRA 2012).

The 2011 study concluded that similar to 2010 there were no apparent overall relationships between downstream migration timing, water temperature, or dissolved oxygen (MCWRA 2012). The report further suggested that that migration timing may be affected by turbidity, with small peaks in migration occurring during small changes in turbidity. However, because turbidity and flow covary, it is difficult to identify the influences of turbidity and flow independently (MCWRA 2012).

Non-salmonid species captured during the 2010 and 2011 surveys conducted by MCWRA (2011, 2012) are presented in those reports.

MCWRA conducts sandbar management at the mouth of the Salinas River as part of its flood control activity (MCWRA 2013a). The Lagoon Monitoring Program, conducted by MCWRA since 2002 was altered in 2010 to be consistent with the NMFS 2009 Biological Opinion for sandbar management at the mouth of the Salinas River (MCWRA 2011). The Biological Opinion (NMFS 2009) calls for fish population sampling in the Salinas River Lagoon during spring (April/May), summer (June-August), and fall (October or early November) (MCWRA 2013a). Sampling is focused on capturing rearing juvenile steelhead that may be present in the lagoon (MCWRA 2013a). The objective of the sampling is to determine whether steelhead are present, and evaluate steelhead distribution, relative abundance (catch per unit effort), and condition (MCWRA 2013a). Sampling is conducted at accessible and appropriate stations from the mouth upstream past Highway 1 to approximately river mile 3. Fish are captured using large beach seines (MCWRA 2013a).

The lagoon monitoring in 2011 began in April with high flows from the Salinas River and an open lagoon (MCWRA 2012). The lagoon was closed for the October sampling. The fish population sampling was conducted May10-11, August 23-24, and October 25-26, with sampling occurring at standard locations. Fish sampling occurred using large beach seines. For the first time since 2002, juvenile steelhead were captured during each of the three sampling periods (MCWRA 2012). However, only one individual was captured during each of the three surveys. The winter conditions of 2010-2011 led to good migration conditions and the flow at Spreckles remaining high through late-May, led to conditions at Arroyo Seco that would support adult steelhead migration (MCWRA 2012), which is in agreement with the smolt trapping conducted during 2011 that documented migration of juvenile steelhead from the Arroyo Seco River with the majority of migrating juveniles being smolts and silvery parr. Smolts would pass quickly through the estuary while parr and young-of-year may spend time rearing in the estuary (MCWRA 2012). The low number of parr and young-of-year migrating from the Arroyo Seco River is consistent with the lack of observed steelhead rearing in the Salinas River lagoon (MCWRA 2012).

The water conditions in 2012 were dry and resulted in low flows during migration periods for adult steelhead in the Salinas River system, but adequate flows for migrating smolts (MCWRA

2012). The late season rain in March and April also led to high flows likely beneficial for smolts (MCWRA 2013a). In 2012, the diversion gates were raised on April 2, 2012 and lowered on April 14, 2012 (due to lack of demand) then raised on May 1, 2012 for the rest of the season (MCWRA 2013a). With a full impoundment behind the inflatable dam, a minimum of 2 cfs was bypassed to the Salinas River Lagoon for 27 days (October 20th thru November 15th) (MCWRA 2013a). Impoundment of water at the SRDF ended on November 15, 2012 and the gates were completely lowered (MCWRA 2013a). During the irrigation season flows were bypassed through the fish ladder and the regulating weir at the SRDF (MCWRA 2013a). Bypass flows averaged 10-22 cfs throughout the season (MCWRA 2013a).

The 2007 NMFS Biological Opinion stated that one of the terms and conditions of the Biological Opinion requested that adult steelhead escapement monitoring be conducted using a Dual Frequency Identification Sonar (DIDSON; Lake Forest Park, Washington, USA). The escapement-monitoring program was to be conducted for a minimum of 10 years, unless NMFS and MCWRA agree to an alternative timeframe. In 2011 an adult steelhead escapement Monitoring program was set up with a combined resistance board weir and VAKI Riverwatcher fish counting system, when the weir became inoperable, a Dual Frequency Identification Sonar was installed and used (MCWRA 2012). Due to multiple factors, monitoring was not conducted during the entire timeframe outlined in the Biological Opinion (December 1 to March 31) (MCWRA 2012). Between January 19, 2011 and February 17, 2011, 23 steelhead passage events were detected by the VAKI Riverwatcher system at the Salinas River Weir, 18 upstream passages, and 5 downstream passages, with a total of 13 adult steelhead documented (MCWRA 2012). Although steelhead cannot be distinguishable from salmon with silhouettes alone, based on passage timings and the fact that the Salinas is not known to support any salmon species, the assumption was made that silhouettes observed were steelhead (Cassagrande et al. 2003, MCWRA 2011).

During the 2012 period monitoring protocols were amended regarding the weir and flow events. Unlike the previous season, the weir was operated during the entire monitoring period (December 1 through March 31) established by the Biological Opinion (NMFS 2007). Weir monitoring was initiated on November 30, 2011 and terminated on April 2, 2012.

From November 30, 2011, through April 2, 2012, the Riverwatcher system recorded a net upstream passage of 17 adult steelhead (19 recorded passing upstream and 2 recorded passing downstream), which was an increase of four adult steelhead net upstream passages during the previous monitoring season (MCWRA 2013a). No apparent relationships between migration timing, flow, water temperature, turbidity, and dissolved oxygen were identified during the 2012 migratory period for steelhead. However, failure to detect such trends and relationship is (at least partially) attributable to a very small population size of steelhead in the Salinas basin (MCWRA 2012). Furthermore, the 2011/2012 winter was relatively "dry" that resulted in only two very small peaks in flow at the weir (MCWRA 2013a). Future monitoring efforts may yield additional information and elucidate relationships between upstream migration of steelhead and environmental variables.

### 3.0.4.2 *Tidewater Goby*

***Status and Distribution***

The tidewater goby (*Eucyclogobius newberryi*) is listed as threatened. It is a small fish that inhabits coastal brackish water habitats entirely within California, ranging from Tillas Slough (mouth of the Smith River, Del Norte County) near the Oregon border south to Agua Hedionda Lagoon (northern San Diego County). The tidewater goby is known to have formerly inhabited at least 134 localities, including the Salinas River. Presently 23 (17 percent) of the 134 documented localities are considered extirpated and 55 to 70 (41 to 52 percent) of the localities are naturally so small or have been degraded over time that long-term persistence is uncertain.

This species was listed by the U.S. Fish & Wildlife Service (USFWS) as endangered in 1994 (USFWS 1994). The 5-year review conducted in 2007 recommended down-listing to threatened status (USFWS 2007). The USFWS has determined that reclassifying the tidewater goby as threatened is warranted, and, has proposed to reclassify tidewater goby as threatened (Federal Register: March 13, 2014; Volume 79, Number 49).

Snyder (1913) did not find tidewater goby in his survey of the Salinas River; however, Hubbs (1947) collected tidewater goby in low to moderate abundance at three locations in the Salinas River Lagoon in August 1946. Tidewater gobies were recently collected again in the Salinas Lagoon in 2013 (HES 2014). Tidewater goby have also been found in Bennett Slough (northern end of Elkhorn Slough) (USFWS 2005). The critical habitat designation for tidewater goby includes Bennett Slough (north of the project area) and the Salinas River (USFWS 2013). The Salinas River however, does not include any special management considerations or protection of the essential physical or biological features, which include water diversions, alterations of water flows, and groundwater overdrafting because location is outside the geographical area occupied by the species at the time of listing.

The following life history and habitat discussion are primarily summarized from the Tidewater Goby Recovery Plan (USFWS 2005) and HES (2014).

***Life History***

Tidewater goby generally live for only 1 year, with few individuals living longer than a year. Reproduction occurs at all times of the year. Spawning activity peaks twice, once during the spring and again in the late-summer. Fluctuations in reproduction are probably due to death of breeding adults in early summer and colder temperatures or hydrologic disruptions in winter. Male tidewater gobies begin digging breeding burrows in relatively unconsolidated, clean, coarse sand, in April or May after lagoons close to the ocean. After hatching, the larval tidewater gobies emerge from the burrow and swim upward to feed on plankton. Juvenile tidewater gobies become benthic dwellers at 16 to 18 mm SL. Tidewater gobies are known to be preyed upon by native species such as small steelhead, prickly sculpin, and staghorn sculpin.

The USFWS characterizes tidewater goby populations (i.e., localities) along the California coast as metapopulations (a group of distinct populations that are genetically interconnected through occasional exchange of animals) (USFWS 2007). While individual populations may be periodically extirpated under natural conditions, a metapopulation is likely to persist through colonization or re-colonization events that establish new populations (USFWS 2007). Local populations of tidewater gobies occupy coastal lagoons and estuaries that, in most cases, are separated from each other by the open ocean. Very few tidewater gobies have ever been captured in the marine environment (Swift et al. 1989), which suggests this species rarely occurs in the open ocean (USFWS 2007). Some tidewater goby populations persist on a consistent basis (potential sources of individuals for re-colonization), while other tidewater goby populations appear to experience intermittent extirpations. Local extirpations may result from one or a series of factors, such as the drying up of some small streams during prolonged droughts, water diversions, and estuarine habitat modifications (USFWS 2007). Some localities where tidewater gobies have been extirpated apparently have been re-colonized when extant populations were present within a relatively short distance of the extirpated population (i.e., less than 6 miles (10 kilometers)). More recently, another tidewater goby researcher has suggested that re-colonizations have typically been between populations separated by no more than 10 miles (16 kilometers). Flooding during winter rains can contribute to re-colonization of estuarine habitats where tidewater goby populations have previously been extirpated. The closest known populations that could recolonize the Salinas River Lagoon is in the Elkhorn Slough. The mouth of Elkhorn Slough is connected to the Salinas River Lagoon through the Old Salinas River. The mouth of Elkhorn Slough is about 7 miles (11 kilometers) north of the Salinas River Lagoon.

***Habitat Characteristics***

The tidewater goby favors the calm conditions that prevail when the lagoons are cut off from the ocean by beach sandbars. They are bottom dwellers and are typically found at water depths of less than 3 feet. Tidewater gobies typically inhabit areas of slow-moving water, avoiding strong wave action or currents. Particularly important to the persistence of the species in lagoons is the presence of backwater, marshy habitats, which provide refuge habitat during winter flood flows. Optimal lagoon habitats are shallow, sandy-bottomed areas, surrounded by beds of emergent vegetation. Open areas are critical for breeding, while vegetation is critical for overwintering survival (providing refuge from high flows) and probably for feeding.

USFWS (2005) identify several criteria for lagoon conditions that favor tidewater gobies. These include: little or no channelization; allowing closure to the ocean for much of the year so that tidal fluctuation is absent or minimal; fresh unconsolidated sand is optimal for reproduction; high quality of inflowing water to increase habitable area of a lagoon in summer. Nutrient enrichment can stimulate algal blooms, deplete oxygen, and lead to hydrogen sulfide formation. Most fish species are intolerant of low dissolved oxygen and high hydrogen sulfide concentrations. Non-native predatory fish should be excluded. Centrarchid fish (sunfish and bass) and tidewater gobies are not usually found together and may not be able to coexist.

Gobies may move upstream during winter rains and high flows of inlet streams as well as during the summer when algal blooms and hydrogen sulfide forms in the substrate and enters the water column. During this period most fish are found at the upper end of lagoons where freshwater inflow occurs or at the seaward end where occasional waves wash into the lagoon.

### 3.0.4.3 *Monterey Roach*

***General Information on the Monterey Roach (Lavinia symmetricus subditus)***

Monterey Roach (*Lavinia symmetricus subditus*) is designated as a California Species of Special Concern (CSC), which is a designation conferred by the CDFW for those species that are considered to be indicators of regional habitat changes or are considered to be potential future protected species. Species of special concern are not necessarily afforded protection under the Fish and Game Code unless they are also identified in the code as California Fully Protected Species. The CSC designation is intended by the CDFW for use as a management tool to take these species into special consideration when decisions are made concerning the development of natural lands.

The Monterey form of California Roach formerly were widely distributed throughout streams in the Monterey Bay drainage, however, they are currently less widely distributed due to habitat loss and interspecific competition (Moyle 2002, MCWRA 2013b). They tend to be most abundant when found by themselves or with just one or two other species (Moyle 2002, MCWRA 2013b). In the absence of predatory fish species, roach will utilize the open waters of pools; otherwise they often stay within pool margins and amongst shallow water areas. Roach are omnivorous, mainly feeding on the bottom, but they can also feed on drift organisms such as terrestrial insects (Moyle 2002, MCWRA 2013b).

Little is known regarding the current status and distribution of Monterey roach in the Salinas River watershed. Monterey roach were collected on the Salinas River at RM 109 during recent rotary screw trap surveys (MCWRA 2013a). However, roach have not been reported to occur in the lower Salinas River, downstream of the Project. Roach have been reported to occur in the warmwater reaches of neighboring watersheds, including lower Natividad Creek/Laurel Pond, the lower Santa Rita Creek drainage, the Reclamation Ditch, Tembladero Slough, and the Old Salinas River.

# 4 IMPACT ANALYSIS METHODS

### 4.0.1 Impact Analysis Approach

The impact assessment addresses impacts on SCCC steelhead, tidewater goby and Monterey roach in the Salinas River by considering the proposed project long-term hydrologic changes associated with each of three diversion scenarios associated with the Groundwater Replenishment Project.

Each scenario is evaluated relative to a baseline condition that is defined as historic flow in the Salinas River near Spreckels plus the Salinas Industrial Wastewater Treatment Facility (Salinas Treatment Facility) outflow plus Salinas stormwater outfall. The baseline condition is also referred to as the Existing Condition scenario. The diversion scenarios are broadly defined as follows:

- Scenario A includes diverting Salinas stormwater outfall and Salinas Treatment Facility outflow, with no diversions from Blanco Drain
- Scenario B includes diverting Salinas stormwater outfall and Salinas Treatment Facility outflow, in addition to 2.99 cfs from Blanco Drain
- Scenario C includes diverting Salinas stormwater outfall and Salinas Treatment Facility outflow, in addition to up to 6 cfs (typically only up to 4.6 cfs) from Blanco Drain

Detailed assumptions associated with each of these scenarios are provided by Schaaf and Wheeler (2014).

The requirements for conducting analyses under CEQA include utilizing the best available information to conduct impact assessments. In the absence of final design specifications associated with all of the project components, environmental documents often rely of the use of qualitative analyses, which rely on an understanding of potential impact mechanisms and understanding of species habitat utilization and life history characteristics. These analyses focus on the types of impacts that could occur on a species that could be present at a general location during a general time of year. For each of the scenarios identified above, the impact mechanism with the highest potential for affecting SCCC steelhead in the Salinas River is a reduction in flow during adult immigration and juvenile outmigration (including smolt outmigration).

Because the diversion scenarios may result in reductions in river flows, the impact assessment focuses on these and other habitat based elements (e.g., water quality). The analytical framework used to assess these potential impacts is described below.

#### 4.0.1.1 *Analytical Tools*

The SCCC steelhead impact assessment relies on historic hydrologic data obtained from the Spreckels gage that has been conditioned based on assumptions regarding stormwater outfall and Salinas Treatment Facility outflow. By conditioning the data based on these assumptions, the historical data effectively became a baseline hydrologic modeling output against which potential alterations in flow associated with implementation of each of the diversion scenarios could be compared. Specifically, the diversion assumptions are applied to the estimated (modeled) baseline flows to obtain a specific set of estimated (modeled) flows associated with each of the diversion scenarios. These "modeled flows" provide a quantitative basis from which to assess the potential impacts of the three diversion scenarios on SCCC steelhead passage in the Salinas River at the Spreckels gage. Detailed discussion of development of the modeled flows is presented in Schaaf and Wheeler (2014).

#### 4.0.1.2 *Model Uncertainty*

The modeled flows used in these analyses, although mathematically precise, should be viewed as having inherent uncertainty. Nonetheless, for planning and impact assessment purposes this approach represents the best available information with which to conduct evaluations of proposed changes in flow diversion, and resulting Salinas River flows. Detailed discussion of specific assumptions used to develop the "modeled" flows is presented in Schaaf and Wheeler (2014).

### 4.0.2 Application of Model Output

Modeled flow results are used for comparative purposes, rather than for absolute predictions, and the focus of the analysis is on differences in the results among comparative scenarios (e.g., a comparison of estimated conditions under Scenario A, relative to the Existing Condition scenario [estimated without-project conditions]). All of the assumptions (e.g., hydrologic conditions, climatic conditions, upstream storage conditions, Salinas Lagoon conditions, etc.) are the same for the baseline, or existing conditions scenario and the diversion scenarios flow estimates, except assumptions associated with the diversion scenario itself, and the focus of the analysis is based primarily on the differences in modeled flow conditions among the three scenarios and the existing condition scenarios.

Raw model output included estimated daily flow for an 82-year period of record, which were conditioned to aggregate data in meaningful ways for the SCCC steelhead evaluation. Daily estimated flow data were used to develop exceedance probability distributions (exceedance curves) by month. These exceedance probability distributions were developed from ranked and sorted data, and show the percentage of time (probability) that a given value is exceeded. These curves show the general long-term differences in flow between an evaluated diversion scenario and the baseline scenario.

### 4.0.3 Impact Indicators

Impact indicators were developed to assess potential Project effects on steelhead life stages and related habitat conditions that are likely to be present in the affected reach of the Salinas River. Migration, both upstream for adults and downstream for adults and juveniles (smolts) are the potentially affected life stages. Potential project affects to these life stages are related to changes in flows. As such, impact indicators were developed as a means to assess potential effects on steelhead passage and migration resulting from each of the different Diversion Scenarios. Specifically, relative changes in modeled flow due to the Diversion Scenario and, predicted changes in frequency of the occurrence of migratory conditions, based on flow-based passage criteria, were used as quantitative indicators of potential effects to steelhead, as discussed in the following sections.

#### 4.0.3.1 *Stream Flow Changes*

Stream flow magnitude and timing are critical components of water supply, water quality, and the ecological integrity of river systems (Poff et al. 1997). Stream flow, which is strongly correlated with many critical physicochemical characteristics of rivers, can be considered a master variable that limits the distribution and abundance of riverine species (Power et al. 1995 and Resh et al. 1988 in Poff et al. 1997).

In order to identify potential effects of the Project's Diversion Scenarios on stream flow, a 10 percent decrease in flow relative to existing conditions was defined as the impact indicator. A decrease in monthly flow of 10 percent or greater has been previously identified by various environmental documents as an appropriate criterion to evaluate flow changes. For example, in the Trinity River Mainstem Fishery Restoration Draft EIS/EIR (USFWS et al. 1999), the USFWS identified reductions in flow of 10 percent or greater as changes that could be sufficient to reduce habitat quantity or quality to an extent that could significantly affect fish. The Trinity River EIS/EIR further states, "…[t]his assumption [is] very conservative…[i]t is likely that reductions in streamflows much greater than 10 percent would be necessary to significantly (and quantifiably) reduce habitat quality and quantity to an extent detrimental to fishery resources." Conversely, the Trinity River EIS/EIR considers increases in streamflow of 10 percent or greater, relative to the basis of comparison, to be "beneficial" to fish species.

In addition to the USFWS et al. (1999) criteria, the San Joaquin River Agreement EIS/EIR (USDOI et al. 1999) used USGS 1977 criteria thresholds, which were derived based on the ability to accurately measure stream flow discharges to ±10 percent. The criterion used to determine impacts associated with implementation of the San Joaquin Agreement was based on average percentage changes to stream flow relative to the basis of comparison. The San Joaquin River Agreement EIS/EIR considered flow changes of less than ±10 percent to be insignificant (USDOI et al. 1999).

The Freeport Regional Water Project Draft EIS/EIR (JSA 2003) used a similar rationale as the USGS documentation for selecting criteria to evaluate changes in flow. The Freeport EIS/EIR states: "Relative to the base case, a meaningful change in habitat is assumed to occur when the change in flow equals or exceeds approximately 10 percent. The 10 percent criterion is based on the assumption that changes in flow less than 10 percent are generally not within the accuracy of flow measurements, and will not result in measurable changes to fish habitat area."

Although the environmental documents listed above have been legally certified (i.e., Trinity River Mainstem Fishery Restoration Record of Decision December 19, 2000; San Joaquin River Agreement Record of Decision in March 1999; Freeport Regional Water Project Record of Decision January 4, 2005), biological justifications specific to using a 10 percent change as a criterion for a meaningful change in habitat affecting fisheries resources in a particular river have not been provided. Nevertheless, these documents apparently have resulted in consensus in the use of 10 percent when evaluating the potential effects of flow changes on fish and aquatic habitat.

Accordingly, this impact assessment relies on previously established information and, therefore, evaluates changes in monthly flow based on differences in frequency of daily flow changes of

10 percent or greater under the diversion versus baseline scenario. Specifically, a change of 10 percent or greater in long term flow, as expressed by flow exceedance probabilities is considered an indicator of potential impact on SCCC steelhead.

#### 4.0.3.2 *Temporal Considerations*

As discussed below, duration and timing are important components of a flow regime (Poff et al. 1997). Therefore, simply evaluating quantitative changes in flow magnitude during an analytical period (i.e., migration periods) could artificially overstate or understate impacts. However, a paucity of information exists regarding site specific effects of changes in flow over specific durations. Thus, utilizing a change in flow that occurs 10% of the time during an analytical evaluation period was used as an indicator of a duration and timing of flow change that could result in an impact on migrating steelhead.

#### 4.0.3.3 *Passage Thresholds*

In addition to the general assessment of the Diversion Scenario's potential effects on flow, specific, potential direct effects on upstream and downstream migration (passage impediments) were identified and evaluated. Specifically, flow levels that provide suitable conditions for upstream and downstream passage were established based on available literature and onsite evaluation at potential passage impediments. These flow values are treated as thresholds, below which passage is impaired, and serve as indicators of potential impact to passage for upstream migrating adults and downstream migrating juveniles and smolts. Specific passage thresholds are described below.

#### 4.0.3.4 *Qualitative Environmental Considerations*

Conducting fully quantitative analyses of potential impacts on steelhead requires information more detailed than is currently available. As such, impact analyses included qualitative assessment of unquantified components of the flow regime that can be used to characterize the entire range of flows and specific hydrologic phenomena (e.g., floods and low flows) that are vital to the integrity of river ecosystems, thus fish species. These components of the flow regime include: (1) magnitude; (2) frequency; (3) duration; (4) timing; and (5) rate of change of hydrologic conditions (Poff et al. 1997). Furthermore, Poff et al. (1997) report that by defining flow regimes in these terms, the ecological consequences of particular human activities that modify one or more components of the flow regime can be considered explicitly. Therefore, while modeled flows are evaluated using specific values as impact indicators (changes in flow of 10% or more, specific flow thresholds); other flow conditions are considered qualitatively in conjunction with quantitative evaluations. That is, the relative changes in magnitude, timing, etc. that are not quantitatively assessed are surrogate for potential change in habitat that conditions, such as rearing and migration associated with flood or high flows.

The requirements for conducting analyses under CEQA include utilizing the best available information to conduct impact assessments. In the absence of final design specifications or other site-specific information (e.g., flow-habitat relationships) environmental documents often rely of the use of qualitative analyses, which rely on an understanding of potential impact mechanisms and a detailed understanding of species habitat utilization and life history characteristics. Therefore, qualitative consideration of general habitat conditions in the potentially affected reaches also is included in the analyses of impacts on steelhead migration.

4.0.3.5 *Water Quality*

The Central Coast Regional Water Quality Control Board (CCRWQCB) Water Quality Control Plan for the Central Coast Basin (Basin Plan) designates beneficial uses of the Salinas River below Spreckels as including municipal and domestic supply, agricultural supply, non-contact water recreation, wildlife habitat, warm and cold water fish habitat, freshwater replenishment (of the Salinas Lagoon) and commercial or sport fishing. The Salinas River is listed as an impaired water body pursuant to Section 303(d) of the Clean Water Act for chlorides, pesticides, Escherichia coli, fecal coliform, nitrate, total dissolved solids, turbidity and other factors. Diversion related impacts that could further degrade water quality conditions and impair associated beneficial uses would be considered an impact indicator.

### 4.0.4 Species Specific Analytical Approach

The potential for changes in flows resulting from implementation of any of the three diversion scenarios to impact SCCC steelhead in the Salinas River is dependent on the ability of the species to use the affected reaches as a migratory corridor.

In addition to evaluating long-term flows, daily exceedance of specific flow thresholds identified in the literature as important for steelhead passage also was evaluated. The number of days when modeled flow in the Salinas River exceeds a specified flow threshold under the baseline scenario and does not exceed the same specified flow under a diversion scenario on the same day represents the number of days under each scenario when the diversion scenario caused modeled flows to be reduced below the threshold.

**Table 4** provides the timing of adult and juvenile presence in the Salinas River identified in various literature sources, as well as flow thresholds important for passage upstream (adults) and downstream (outmigrating juveniles and smolts).

**Table 4 – SCCC Steelhead life history periodicity and flow thresholds required for migratory passage in the Salinas River identified from various literature sources.**

| Life stage | Time Period* | Flow (in cfs) Required Downstream of Spreckles Gage for Steelhead Migratory Passage | Source Document | Notes** |
|---|---|---|---|---|
| Smolt Outmigration | March through June | N/A | NMFS 2007, Page 23 | In California, the outmigration of steelhead smolts typically begins in March and ends in late May or June (Titus *et al.* 2002). |
| | April through June | N/A | NMFS 2007, Page 23 | Snider (1983) states that in the Carmel River, most juvenile steelhead migrate to the ocean between April and June. |

| | | | | |
|---|---|---|---|---|
| | March through June | N/A | NMFS 2007, Page 74 | However, to assist our assessment of the project's effects on flows for smolt outmigration, we have assumed that properly functioning habitat conditions for this phase of the steelhead life history include substantial sustained flows for several weeks during the period of migration (late March through early June). |
| | Year-Round with peak emigration from April through June | 56 | MCWRA 2001, Section 5.6 | If a depth criteria of 0.4 feet is substituted in the analysis of passage transects in the Salinas River the resulting minimum passage flow estimates for downstream migration of post-spawning adults and smolts would be 112 cfs upstream of Spreckels and 56 cfs downstream of Spreckels. |
| | | 50 | | If it is also assumed that the 0.4 foot depth criteria were achieved over a continuous 8 foot channel width rather than 10% of the channel width, the minimum passage flow estimate would be further reduced to 59 cfs upstream of Spreckels and 50 cfs downstream of Spreckels. |
| | January through June | N/A | MCWRA 2013b, Page 3-118 | Steelhead smolts may immigrate to the ocean from January through June on the receding limb of the winter hydrograph. |
| | December 15 through March 31 | N/A | MCWRA 2013b, Page 3-119 | Seaward migration of juveniles may end earlier as compared to the other coastal drainages, because a greater amount of flow is required to provide safe passage conditions in the broad, sandy Salinas riverbed and the migration from rearing habitat in the tributaries is greater than 50 miles. NMFS (2003, p. 24) noted December 15 to March 31 as the juvenile steelhead migration season, which likely considers the above factors. |
| | March through June | N/A | MCWRA 2013b, Page 3-128-129 | … and steelhead smolt migration typically begins in March and ends in late-May or June, depending on flow and passage conditions. |
| | Jan 15 through May | N/A | MCWRA 2013b, Page 3-134 | …and downstream juvenile/kelt migration (mid-January through the end of May). |
| **Adult Immigration** | December 1 through April 15 | 72 | MCWRA 2001, Section 5.6 | Based on the Thompson criteria, a flow of about 72 cfs would meet the minimum migration needs for steelhead in the Lower Salinas downstream of Spreckels and a flow of 154 cfs would meet the minimum migration criteria upstream of Spreckels. Less flow is required downstream of Spreckels since the channel is narrower and more confined in this reach. |
| | | 60 | | Using the less restrictive width criterion of 8 feet instead of 25%, minimum passage flow estimates for adult steelhead in the Salinas River would be 94 cfs upstream of Spreckels and 60 cfs downstream of Spreckels. |
| | January through May | N/A | Moyle 2008, Page 80 | Adult steelhead return from the ocean to enter watersheds to spawn in SCC stream between January and May (Boughton et al. 2006) |
| | December | N/A | MCWRA 2013b, | NMFS indicates that adult steelhead in |

| | | | | |
|---|---|---|---|---|
| | through April | | Page 3-118 | this region migrate upstream primarily from December to April (NMFS 2007) |
| | November through June | N/A | NMFS 2007, Page 23 | Adult steelhead migrate to fresh water between November and June, peaking in March. |
| | December through April | N/A | NMFS 2007, Page 69 - 70 | Although the exact timing of adult upstream migration in the Salinas River is not known, data from other Central California coastal streams indicate that adult steelhead in this area migrate upstream primarily from December through April (Figure 11) |
| * Time periods provided represent the widest range indicated by the source document. For example, if a source document indicates a time period beginning sometime in March and ending in late May or June, the time period selected includes March through June | | | | |
| ** Time periods are selected based on source documents evaluated (e.g., NMFS 2007, MCWRA 2013b), although the source documents may cite additional sources. | | | | |

#### 4.0.4.1 *Analytical Time Periods*

Based on information presented in Table 4 comparisons of modeled flows for the three diversion scenarios, relative to the baseline scenario (the Existing Condition scenario), are conducted for the following life stages and life history periodicities:

- Adult Immigration (December through April)
- Juvenile and Smolt Emigration (March through June)

These time periods were selected for evaluation in this analysis to evaluate the bulk of the upstream migration and downstream emigration periods. The evaluation is intended to encompass the majority of steelhead migration in the Salinas River, including the peak migration periods, without potentially overestimating impacts.

#### 4.0.4.2 *Analytical Passage Threshold Flow Indicator Values*

Two sets of passage flow indicator values were evaluated to assess passage potential of upstream migrating adult steelhead and downstream migrating juveniles. As described in MCWRA (2001), these thresholds were based on evaluation of stream conditions as part of the Salinas Valley Water Project Draft Master EIR. MCWRA estimated passage flow requirements using field measurement of channel and flow characteristics and the application of objective criteria for conditions suitable for adult steelhead upstream migration based on water depth transects at critical passage sites using a method developed by Thompson (1972). MCWRA (2001) further states that the minimum flow for steelhead adult immigration occurs when, at the shallowest cross-sections, there is a depth of at least 0.6 feet across 25% of the channel width and there is a continuous section this deep across at least 10% of the channel width. Based on these criteria, a flow of about 72 cfs would meet the minimum migration needs for steelhead in the Lower Salinas downstream of the Spreckels gage. However, MCWRA (2001) noted that under some situations the 0.6 foot depth over 25% channel width criteria have been considered to be overly restrictive and less conservative criteria have been applied. Using a less restrictive width criterion of 8 feet instead of 25%, minimum passage flow estimates for adult steelhead in the Salinas River would be 60 cfs downstream of Spreckels (RM 13.2).

Because juvenile passage criteria have not been widely developed, MCWRA (2001) modified the adult upstream passage criteria to accommodate downstream migrating juveniles based on the assumption that emigrating juvenile steelhead can migrate downstream over riffle areas at shallower depths than those needed by adults migrating upstream. If a depth criterion of 0.4 feet is substituted in the analysis of passage transects in the Salinas River the resulting minimum passage flow estimates for downstream migration of smolts would be 56 cfs downstream of Spreckels. If it is also assumed that the 0.4 foot depth criteria were achieved over a continuous 8 foot channel width rather than 10% of the channel width, the minimum passage flow estimate would be further reduced to 50 cfs downstream of Spreckels (MCWRA 2001).

Therefore, the following passage flow indicator values were evaluated:

- Adult Immigration – 60 cfs and 72 cfs at Spreckels
- Juvenile and Smolt Emigration – 50 cfs and 56 cfs at Spreckels

### 4.0.5 Evaluation Criteria and Significance Thresholds

As described above, a 10 percent scenario-induced change in existing flow, as well as 10 percent scenario-induced changes in flows that occur 10 percent or more of the time, are used as impact indicators, but are not meant to serve as a significance thresholds for CEQA purposes. Instead, these impact indicators serve as mechanisms to compare a Diversion Scenario to a baseline condition. Additionally, site-specific flow thresholds and qualitative consideration of general habitat and flow conditions also are utilized in conducting the evaluation of flow-related impacts on steelhead. Impact determinations will be based on consideration of all evaluated impact indicators for all life stages for a particular species.

The California Environmental Quality Act (CEQA) Guidelines provide a discussion of significance criteria for evaluation of environmental effects of a project. Specifically, significance criteria represent the thresholds that were used to identify whether an impact would be considered significant under CEQA. However, these significance criteria do not provide quantitative thresholds against which simulated hydrologic data can be compared to identify potential impacts. Appendix G of the CEQA Guidelines suggests the following evaluation criteria for biological resources:

Would the project:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;
- Conflict with any local policies or ordinances protecting fishery resources; or

- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan?

The evaluation criteria used for impact analysis represent a combination of the Appendix G criteria and professional judgment that considers current regulations, standards, and/or consultation with agencies, knowledge of the area, and consideration of the context and intensity of the environmental effects. Specifically, for the SCCC steelhead impact assessment, significance determinations are based on consideration of all evaluated impact indicators (e.g., 10 percent change in long-term flow, differences in exceedance of flow thresholds). An impact is considered significant if implementation of the Diversion Scenario would substantially adversely affect steelhead based on evaluation of the changes in flows. For the purposes of this analysis, the effect of a Diversion Scenario would be considered less than significant if it would result in any of the following:

- A change in average monthly stream flow of less than 10%.
- A change in flow of less than 10%, relative to specific flow thresholds during steelhead adult or smolt migration periods.
- Changes in flow that occur less than 10% of the time during the analytical period

Furthermore, for an impact to be considered less than significant, implementation of a Diversion Scenario will not cause creation of an obstacle or hazard to migrating steelhead (adults, juveniles or smolts).

Therefore, for the purposes of this analysis, a diversion Case scenario would result in a significant impact to aquatic biological resources if it would result in the following:

- A substantial adverse effect (directly, through habitat modifications, by interfering with the movement of native fish species, or by impeding the use of native fish nursery/rearing sites) on SCCC steelhead.

# 5 IMPACT ANALYSIS

The impact assessment of aquatic biological resources consisted of a comparative evaluation of hydrologic conditions (i.e., change in flow frequency, change in flow based habitat availability) between current conditions and each of the diversion scenarios.

The quantitative assessment of potential flow-related impacts included evaluation of: (1) changes in monthly long-term flows (exceedance probability distributions based on hydrologic record of 82 years) using occurrence (> 10 percent of the time) of a 10 percent or more reduction in simulated diversion scenario flow conditions, relative to a baseline condition as indicators of impact; and (2) differences in occurrence of suitable fish passage conditions using percent reduction in current daily flows from suitable to unsuitable relative to meeting specified passage thresholds (Table 4). Qualitative interpretation of flow changes, relative to general habitat conditions and water quality is also considered in the analysis.

Implication of effects on aquatic resources using an analysis of flow exceedance is complicated by the runoff patterns in coastal streams, like the Salinas River; coastal, rain dominated streams display substantial variation in flows during most months, as clearly depicted in the nearly vertical portion of the exceedance curves with the Y-axis scaled to 100 cfs (**Figure 1b**). These curves suggest that exceedance probability between 10 cfs and 100 cfs is typically less than 15 percent, which means that when flows reach 10 cfs they are likely to reach 100 cfs and that flows greater than 10 cfs are infrequent. Furthermore, evaluation of the exceedance probability distributions indicates that, while flows can get very high in any month, flows generally are substantially less than 80 percent of the maximum flow over 80 percent of the time. For example, during December the maximum modeled flow under the baseline condition (the Existing Condition scenario) is over 39,000 cfs. However, modeled flows are below approximately 55 cfs for 80 percent of the time and are below approximately 15 cfs for 50 percent of the time. Therefore, substantial flow reductions, as indicated by reductions of 10 percent or more, occur more frequently at lower flows simply because small reductions in flow represent a large percentage of the total flow. As such, evaluating only the percentage of time when flow reductions of 10 percent or more occur may be misleading when considered as an indicator of impacts on biological resources and their habitats because a 10 percent reduction in flow would not necessarily result in a substantial loss of migratory habitat or a substantial reduction in passage potential, as summarized below. In such cases, best professional judgment is used to determine whether impacts associated with these reductions would be considered substantial.

### 5.0.1 Scenario A Analysis

As described by Schaaf and Wheeler (2014), Scenario A reduces flow in the Salinas River by diverting City of Salinas stormwater (RM 11.2) and Salinas Treatment Facility inflow (RM 9.2-10.7). Scenario A does not include Blanco Drain diversions. The effect of Scenario A on Salinas River flow was analyzed at RM 4.7.

Overall, Scenario A diverts less than 1 percent of the baseline mean annual flow (Schaaf and Wheeler 2014). However, due to the flashy nature of runoff in the Salinas River, the majority of flow occurs during a very brief period, which means that the likelihood of Scenario A (diversion rate of 3 cfs) to incur a 10 percent or greater reduction in flow (i.e., when flow is 30 cfs or less), is high. The probability of exceeding 30 cfs (i.e., exceedance probability) ranges from the highest probability of exceedance of 66 percent in February to less than 16 percent in June. As such, exceedance probability distributions of modeled daily flows aggregated by month from December through June (encompassing both the adult immigration and juvenile outmigration periods) indicate that flows under Scenario A are generally similar (slightly reduced), relative to the baseline scenario (the Existing Condition scenario) when flows are above 30 cfs during all months evaluated (**Figure 1**). However, flow reductions range from occurring approximately 34 percent of the time during February to approximately 84 percent of the time during June. **Table 5** displays the percentage of time when reductions in flow attributable to Scenario A diversion occur in the December through June period. Further, as flow decreases below 30 cfs, relatively small flow reductions resulting from increased diversions under Scenario A become proportionately greater, which occurs during all months evaluated. Therefore, reductions in flow of 10 percent or more occur during all months of the SCCC steelhead adult immigration and juvenile outmigration periods under Scenario A.

A more direct assessment of diversion effects on steelhead evaluates the reduction in suitable fish passage conditions under Scenario A. Therefore, each of the identified passage flow indicator values was evaluated. Specifically, the number and percentage of days in each month (over the entire 82-year period of record) was identified when Scenario A resulted in reducing flow from above to below a migratory flow threshold (**Table 6**). Suitable migration flows were reduced below each of the passage flow indicator values less than 1 percent of the time under Scenario A, relative to the Existing Condition scenario (Table 6).

Overall occurrence of suitable adult steelhead migration conditions (i.e., occurrence of threshold flows) were reduced about 1 percent for both the 60 cfs and 72 cfs thresholds (Table 6). The 60 cfs threshold was reduced a total of 58 days out of the 12,434 days modeled during the upstream migration period (December-April). In comparison to existing conditions, the percent occurrence of 60 cfs or greater flows during the upstream migration period was reduced 0.5 percent, from 46.5 to 46.0 percent. Percent reductions ranged from 0.1 percent in April to 0.7 percent in December and January. The net change in days meeting the 60 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 1 percent overall (58 out of 5,773 days). Net reduction ranged from 0.3 percent in April to 3.5 percent in December.

Similarly, the 72 cfs threshold was reduced 54 days out of the 12,434 days modeled during the upstream migration period (December-April). The percent occurrence of 72 cfs or greater flows during the upstream migration period was reduced 0.4 percent, from 45.0 to 44.6 percent. Percent reductions ranged from 0.3 percent in March to 0.6 percent in December. The net change in days meeting the 72 cfs threshold was less than 1 percent overall (54 out of 5,598 days). Net reduction ranged from 0.5 percent in April to 3.2 percent in December.

Overall occurrence of suitable juvenile steelhead migration conditions (i.e., occurrence of threshold flows) were reduced less than 1 percent for both the 50 cfs and the 56 cfs thresholds (Table 6). The 50 cfs threshold was reduced a total of 51 days out of the 10,004 days modeled during the downstream migration period (March-June). In comparison to existing conditions, the percent occurrence of 50 cfs or greater flows during the upstream migration period was reduced 0.5 percent, from 37.8 to 37.3 percent. Percent reductions ranged from 0.2 percent in June to 0.9 percent in May. The net change in days meeting the 50 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 1.3 percent overall (51 out of 3,780 days). Net reduction ranged from 0.8 percent in March to 3.1 percent in May.

Similarly, the 56 cfs threshold was reduced 43 days out of the 10,004 days modeled. The percent occurrence of 56 cfs or greater flows during the upstream migration period was reduced 0.4 percent, from 37.0 to 36.6 percent. Percent reductions ranged from 0.2 percent in June to 0.6 percent in May. The net change in days meeting the 56 cfs threshold was 1.2 percent overall (43 out of 3,700 days). Net reduction ranged from 0.8 percent in March to 2.1 percent in May.

Schaff and Wheeler (2014) report that the stormwater runoff is generally of equal or better quality than the Salinas River, which receives it. Stormwater runoff meets the Central Coast RWQCB Basin Plan objectives in most categories. In the categories of turbidity and orthophosphate, it exceeds the basin plan objectives but is below the average concentration in the receiving stream. Diverting stormwater runoff to the Proposed Project should, therefore, have no appreciable effect on water quality within the Salinas River.

Effluent from the SIWTF is also generally of equal or better quality than the Salinas River. The exception in this case is Total Dissolved Solids (TDS), which exceeds both the Basin Plan objective and the quality of the receiving stream. Diverting Industrial Wastewater to the Proposed Project may result in reduced TDS levels in the river, particularly in summer months during low flow periods, outside the steelhead migration periods.

#### 5.0.1.1 *Scenario A Conclusion*

In general, modeled flows were reduced under Scenario A, relative to the Existing Condition scenario. Implementation of Scenario A is anticipated to reduce flows in the Salinas River during the SCCC steelhead adult immigration period by 1 percent and during the juvenile outmigration period by about 1.3 percent, relative to existing conditions. However, the effect of Scenario A on occurrence of suitable fish passage conditions (passage thresholds) is very infrequent (monthly reductions in flows meeting passage thresholds, relative to existing conditions occur from less than 1% of the time to no more than just over 3 percent of the time during juvenile and adult migration periods). Furthermore, flow reductions which seem disproportionately high during the lowest flow periods, are likely to have relatively little effect on steelhead migration. Implementation of Scenario A would not have an effect on the occurrence of high flows, flows greater than 100 cfs, which are more closely associated with steelhead migration than the threshold flows used in this evaluation, nor on availability of potential rearing habitat associated with side channel and flood plain inundation. Therefore, in consideration of the timing, frequency, magnitude, and duration of flow changes that could occur associated with implementing Scenario A, these flow changes are not considered to be substantial impacts on SCCC Steelhead.

There is a limited potential for tidewater goby and Monterey roach to occur downstream of the project site. Since these species prefer quiescent conditions, flow reductions would not be expected to have a detrimental effect on them, should they be present

Additionally, removing stormwater runoff and Salinas Treatment Facility effluent should have no appreciable effect on water quality within the Salinas River.

Overall, flow reductions associated with implementation of Scenario A, relative to the Existing Condition is considered to be ***Less than Significant*** on SCCC Steelhead, Monterey roach, and tidewater goby.

### 5.0.2 Scenario B Analysis

As described by Schaaf and Wheeler (2014), Scenario B reduces flow in the Salinas River by diverting City of Salinas stormwater (RM 11.2) and Salinas Treatment Facility inflow (RM 9.2-10.7) as well as 2.99 cfs from Blanco Drain (RM 5.1). The effect of Scenario B on Salinas River flow was analyzed at RM 4.7.

Overall, Scenario B diverts less than 1.5 percent of the baseline mean annual flow (Schaaf and Wheeler 2014). However, as discussed above, due to the flashy nature of runoff in the Salinas River, the majority of flow occurs during a very brief period, which means that the likelihood of Scenario B (diversion rate of 5.99 cfs) to incur a 10 percent or greater reduction in flow (i.e., when flow is 60 cfs or less), is high. The probability of exceeding 60 cfs ranges from the highest probability of exceedance of 62 percent in February to less than 11 percent in June. As such, exceedance probability distributions of modeled daily flows aggregated by month from December through June (encompassing both the adult immigration and juvenile outmigration periods) indicate that flows under Scenario B are generally similar (slightly reduced), relative to the baseline scenario (the Existing Condition scenario) when flows are above 60 cfs during all months evaluated (**Figure 2**). However, flow reductions range from occurring approximately 39 percent of the time during February to approximately 89 percent of the time during June. **Table 7** displays the percentage of time when reductions in flow attributable to Scenario B diversion occur in the December through June period. Further, as flow decreases below 60 cfs, relatively small flow reductions resulting from increased diversions under Scenario B become proportionately greater, which occurs during all months evaluated. Therefore, reductions in flow of 10 percent or more occur during all months of the SCCC steelhead adult immigration and juvenile outmigration periods under Scenario B.

However, as previously described for Scenario A, substantial flow reductions, as indicated by reductions of 10 percent or more, occur more frequently at lower flows simply because small reductions in flow represent a large percentage of the total flow when a 10 percent reduction in flow would not necessarily result in a substantial loss of migratory habitat or a substantial reduction in passage potential. Therefore, as discussed above, evaluating only the percentage of time when flow reductions of 10 percent or more occur may confound the analysis.

A more direct assessment of diversion effects on steelhead evaluates the reduction in suitable fish passage conditions due to Scenario B. Therefore, each of the identified passage flow indicator values was evaluated. Specifically, the number and percentage of days in each month (over the entire 82-year period of record) was identified when Scenario B resulted in reducing flow from above to below a migratory flow threshold (**Table 8**).

Overall occurrence of suitable adult steelhead migration conditions (i.e., occurrence of threshold flows) were reduced less than 2 percent for both the 60 cfs and 72 cfs thresholds (Table 8). The 60 cfs threshold was reduced a total of 104 days out of the 12,434 days modeled during the upstream migration period (December-April). In comparison to existing conditions, the percent occurrence of 60 cfs or greater flows during the upstream migration period was reduced 0.9 percent, from 46.5 to 45.6 percent. Percent reductions ranged from 0.4 percent in March and April to 1.2 percent in December. The net change in days meeting the 60 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 1.8 percent overall (104 out of 5,773 days). Net reduction ranged from 0.7 percent in March to 6.3 percent in December.

Similarly, the 72 cfs threshold was reduced 84 days out of the 12,434 days modeled during the upstream migration period (December-April). The percent occurrence of 72 cfs or greater flows during the upstream migration period was reduced 0.6 percent, from 45.0 to 44.4 percent. Percent reductions ranged from 0.4 percent in March to 0.9 percent in December. The net change in days meeting the 72 cfs threshold was 1.5 percent overall (104 out of 5,598 days). Net reduction ranged from 0.7 percent in March to 4.9 percent in December.

Overall occurrence of suitable juvenile steelhead migration conditions (i.e., occurrence of threshold flows) were reduced about 2 percent for both the 50 cfs and the 56 cfs thresholds (Table 8). The 50 cfs threshold was reduced a total of 80 days out of the 10,004 days modeled during the downstream migration period (March-June). In comparison to existing conditions, the percent occurrence of 50 cfs or greater flows during the upstream migration period was reduced 0.8 percent, from 37.8 to 37.0 percent. Percent reductions ranged from 0.4 percent in June to 1.7 percent in May. The net change in days meeting the 50 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 2.1 percent overall (80 out of 3,780 days). Net reduction ranged from 1.0 percent in March to 5.5 percent in May.

Similarly, the 56 cfs threshold was reduced 73 days out of the 10,004 days modeled. The percent occurrence of 56 cfs or greater flows during the upstream migration period was reduced 0.7 percent, from 37.0 to 36.3 percent. Percent reductions ranged from 0.6 percent in June to 0.9 percent in May. The net change in days meeting the 56 cfs threshold was 2.0 percent overall (73 out of 3,700 days). Net reduction ranged from 1.2 percent in March to 5.5 percent in May.

Effects on water quality are as described above, for Scenario A.

### 5.0.3 Scenario B Conclusion

In general, modeled flows were reduced under Scenario B, relative to the Existing Condition scenario. Implementation of Scenario B is anticipated to reduce flows in the Salinas River during the SCCC steelhead adult immigration period by 1.8 percent and during the juvenile outmigration period by about 2.1 percent relative to existing conditions. However, the effect of Scenario B on occurrence of suitable fish passage conditions (passage thresholds) is very infrequent (monthly reductions in flows meeting passage thresholds relative to existing conditions occur from less than 1% of the time to no more than 5.5 percent of the time during juvenile and adult migration periods). Furthermore, flow reductions would be disproportionately high during the lowest flow periods. Implementation of Scenario B would not have an effect on the occurrence of high flows, flows greater than 100 cfs, which are more closely associated with steelhead migration than the threshold flows used in this evaluation, nor on availability of potential rearing habitat associated with side channel and flood plain inundation. Therefore, in consideration of the timing, frequency, magnitude, and duration of flow changes that could occur associated with implementing Scenario B, these flow changes are not considered to be substantial impacts on SCCC Steelhead.

There is a limited potential for tidewater goby and Monterey roach downstream of the project site. Since these species prefer quiescent conditions, flow reductions would not be expected to have a detrimental effect on them, should they be present

Additionally, removing stormwater runoff and Salinas Treatment Facility effluent should have no appreciable effect on water quality within the Salinas River.

Overall, flow reductions associated with implementation of Scenario B, relative to the Existing Condition is considered to be ***Less than Significant*** on SCCC Steelhead, Monterey roach, and tidewater goby.

### 5.0.4 Scenario C Analysis

As described by Schaaf and Wheeler (2014), Scenario C, similar to Scenario B, reduces flow in the Salinas River by diverting City of Salinas stormwater (RM 11.2) and Salinas Treatment Facility inflow (RM 9.2-10.7) as well as from Blanco Drain (RM 5.1). Under Scenario C, diversion from Blanco Drain is 6 cfs (rather than 2.99 cfs under Scenario B). The effect of Scenario C on Salinas River flow was analyzed at RM 4.7.

Overall, Scenario C diverts less than 2 percent of the baseline mean annual flow (Schaaf and Wheeler 2014). However, as discussed above, due to the flashy nature of runoff in the Salinas River, the majority of flow occurs during a very brief period, which means that the likelihood of Scenario C (diversion rate of 8.99 cfs) to incur a 10 percent or greater reduction in flow (i.e., when flow is 90 cfs or less), is high. The probability of exceeding 90 cfs ranges from the highest probability of exceedance of 60 percent in February to less than 10 percent in June. As such, exceedance probability distributions of modeled daily flows aggregated by month from December through June (encompassing both the adult immigration and juvenile outmigration periods) indicate that flows under Scenario C are generally similar (slightly reduced), relative to the baseline scenario (the Existing Condition scenario) when flows are above 90 cfs during all months evaluated (**Figure 3**). However, flow reductions ranges from occurring approximately 40 percent of the time during February to approximately 90 percent of the time during June. **Table 9** displays the percentage of time when reductions in flow attributable to Scenario A diversion occur in the December through June period. Further, as flow decreases below 90 cfs, relatively small flow reductions resulting from increased diversions under Scenario C become proportionately greater, which occurs during all months evaluated. Therefore, reductions in flow of 10 percent or more occur during all months of the SCCC steelhead adult immigration and juvenile outmigration periods under Scenario C.

However, as previously described for Scenario A, substantial flow reductions, as indicated by reductions of 10 percent or more, occur more frequently at lower flows simply because small reductions in flow represent a large percentage of the total flow when a 10 percent reduction in flow would not necessarily result in a substantial loss of migratory habitat or a substantial reduction in passage potential. Therefore, as discussed above, evaluating only the percentage of time when flow reductions of 10 percent or more occur may confound the analysis.

A more direct assessment of diversion effects on steelhead evaluates the reduction in suitable fish passage conditions due to Scenario C. Therefore, each of the identified passage flow indicator values was evaluated. Specifically, the number and percentage of days in each month (over the entire 82-year period of record) was identified when Scenario C resulted in reducing flow from above to below a migratory flow threshold (**Table 10**). Suitable migration flows were reduced below each of the passage flow indicator values less than 2 percent of the time under Scenario C, relative to the Existing Condition scenario.

Overall occurrence of suitable adult steelhead migration conditions (i.e., occurrence of threshold flows) were reduced about 2 percent for both the 60 cfs and 72 cfs thresholds (Table 10). The 60 cfs threshold was reduced a total of 119 days out of the 12,434 days modeled during the upstream migration period (December-April). In comparison to existing conditions, the percent occurrence of 60 cfs or greater flows during the upstream migration period was reduced 1.0 percent, from 46.5 to 45.5 percent. Percent reductions ranged from 0.5 percent in March to 1.3 percent in December. The net change in days meeting the 60 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 2.1 percent overall (119 out of 5,773 days). Net reduction ranged from 0.9 percent in March to 6.7 percent in December.

Similarly, the 72 cfs threshold was reduced 110 days out of the 12,434 days modeled during the upstream migration period (December-April). The percent occurrence of 72 cfs or greater flows during the upstream migration period was reduced 0.9 percent, from 45.0 to 44.1 percent. Percent reductions ranged from 0.6 percent in March to 1.1 percent in January. The net change in days meeting the 72 cfs threshold was 2.0 percent overall (110 out of 5,598 days). Net reduction ranged from 0.9 percent in March to 5.6 percent in December.

Overall occurrence of suitable juvenile steelhead migration conditions (i.e., occurrence of threshold flows) were reduced less than 3 percent for both the 50 cfs and the 56 cfs thresholds (Table 10). The 50 cfs threshold was reduced a total of 104 days out of the 10,004 days modeled during the downstream migration period (March-June). In comparison to existing conditions, the percent occurrence of 50 cfs or greater flows during the upstream migration period was reduced 1.0 percent, from 37.8 to 36.8 percent. Percent reductions ranged from 0.5 percent in June to 1.8 percent in May. The net change in days meeting the 50 cfs threshold (i.e., reduction in days meeting the threshold under existing conditions) was 2.8 percent overall (104 out of 3,780 days). Net reduction ranged from 1.6 percent in March to 6.0 percent in May.

Similarly, the 56 cfs threshold was reduced 96 days out of the 10,004 days modeled. The percent occurrence of 56 cfs or greater flows during the upstream migration period was reduced 1.0 percent, from 37.0 to 36.0 percent. Percent reductions ranged from 0.7 percent in June to 1.3 percent in May. The net change in days meeting the 56 cfs threshold was 2.6 percent overall (96 out of 3,700 days). Net reduction ranged from 1.6 percent in March to 6.5 percent in May.

Effects on water quality are as described above, for Scenario A.

### 5.0.5 Scenario C Conclusion

In general, modeled flows were reduced under Scenario C, relative to the Existing Condition scenario. Implementation of Scenario C is anticipated to reduce flows in the Salinas River during the SCCC steelhead adult immigration period by up to 2.1 percent and during the juvenile outmigration period by up to 2.8 percent relative to existing conditions. However, the effect of Scenario C on occurrence of suitable fish passage conditions (passage thresholds) is very infrequent (monthly reductions in flows meeting passage thresholds relative to existing conditions occur from less than 1% of the time to no more than 5.5 percent of the time during juvenile and adult migration periods). Furthermore, flow reductions would be disproportionately high during the lowest flow periods. Implementation of Scenario B would not have an effect on the occurrence of high flows, flows greater than 100 cfs, which are more closely associated with steelhead migration than the threshold flows used in this evaluation, nor on availability of potential rearing habitat associated with side channel and flood plain inundation. Therefore, in consideration of the timing, frequency, magnitude, and duration of flow changes that could occur associated with implementing Scenario C, these flow changes are not considered to be substantial impacts on SCCC Steelhead.

There is a limited potential for tidewater goby and Monterey roach downstream of the project site. Since these species prefer quiescent conditions, flow reductions would not be expected to have a detrimental effect on them, should they be present.

Additionally, removing stormwater runoff and Salinas Treatment Facility effluent should have no appreciable effect on water quality within the Salinas River.

Therefore, in consideration of the timing, frequency, magnitude, and duration of flow changes that could occur associated with implementing Scenario C, as well as improvements in water quality, implementation of Scenario C is considered to be ***Less than Significant*** on SCCC Steelhead, Monterey roach, and tidewater goby.

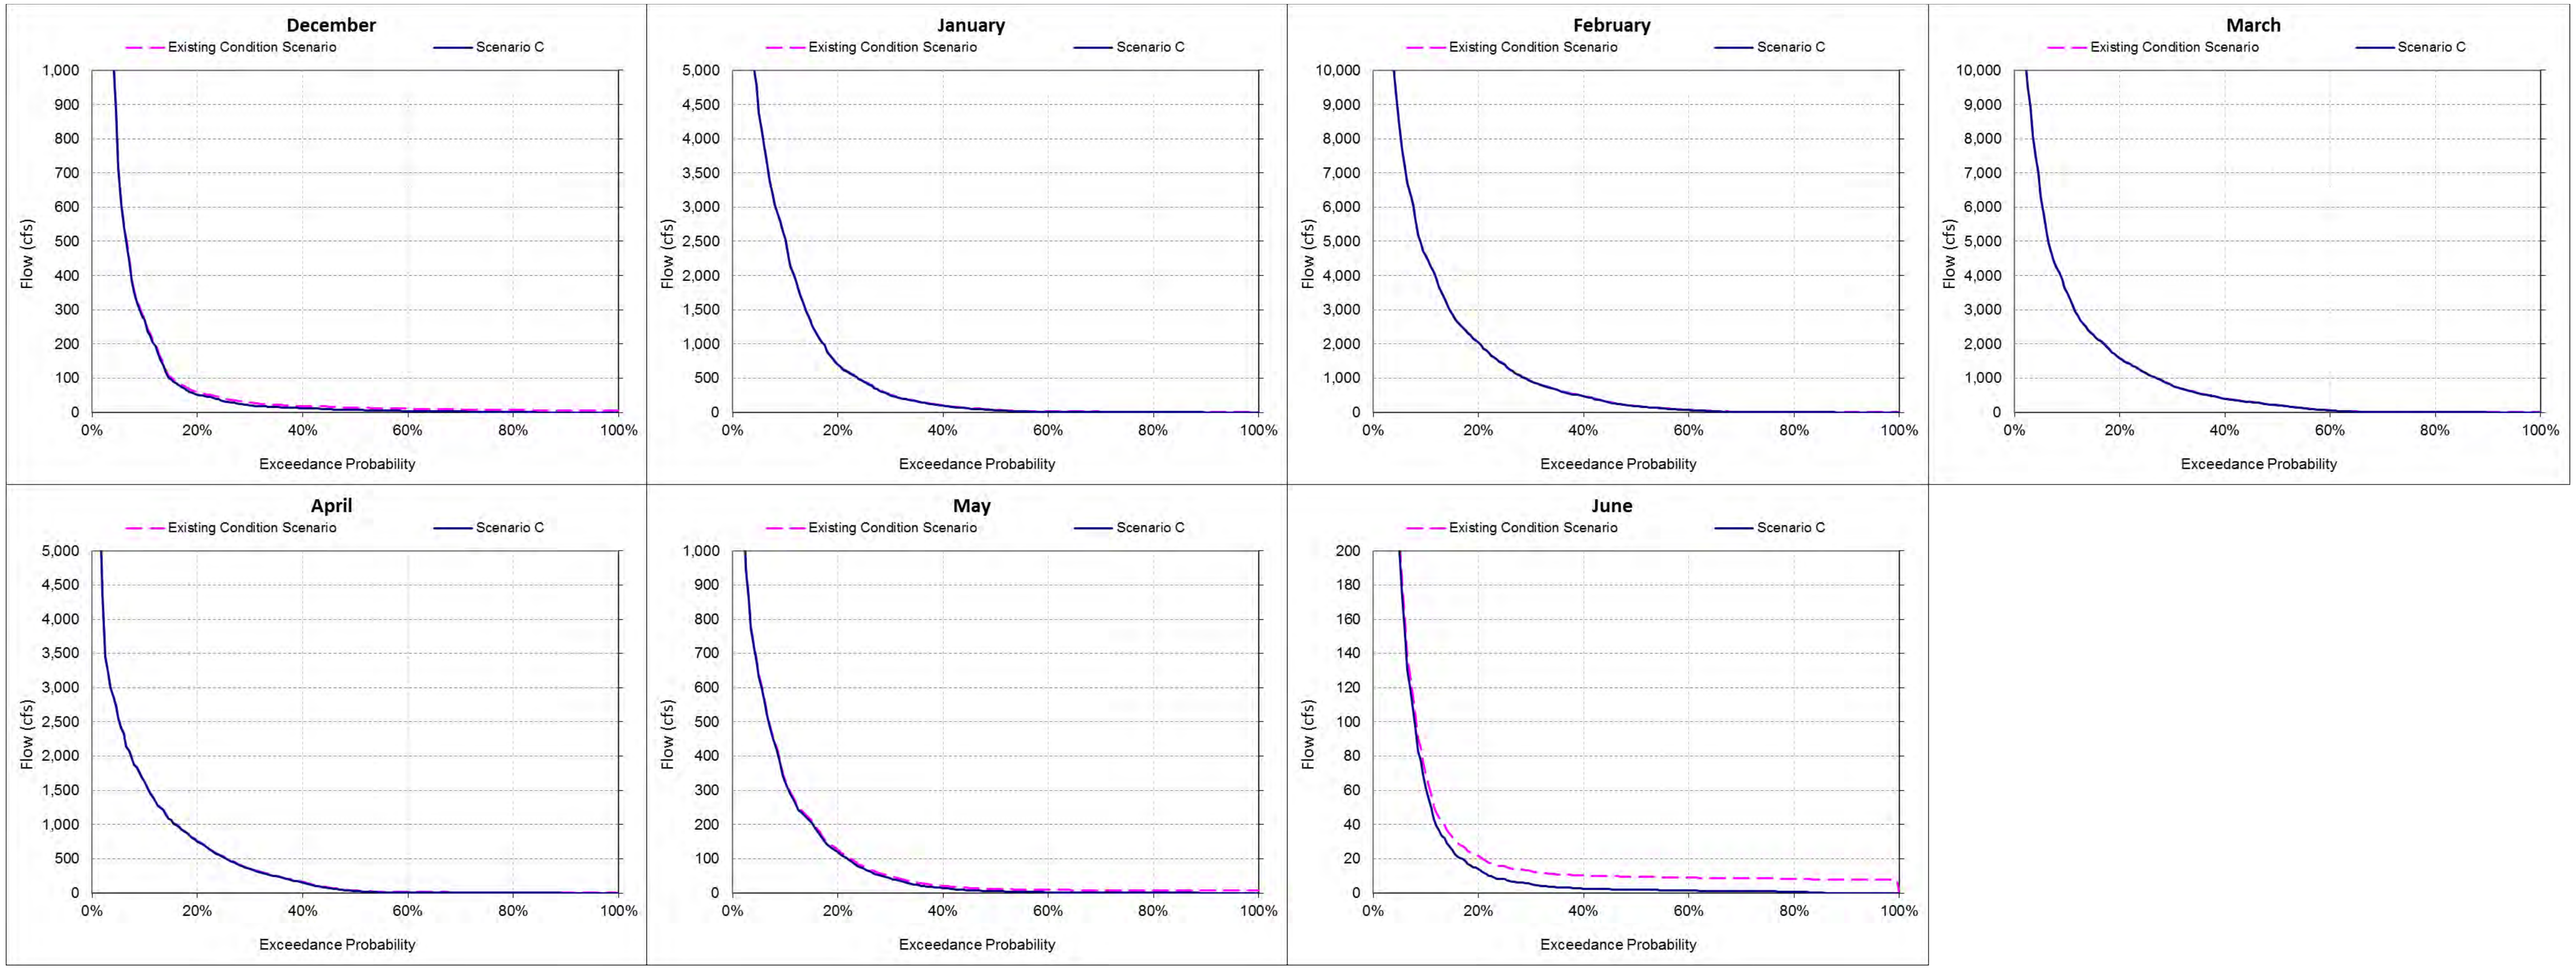

**Figure 3a – Monthly exceedance probability distributions of modeled daily flows for Scenario C, relative to the Existing Condition scenario.**

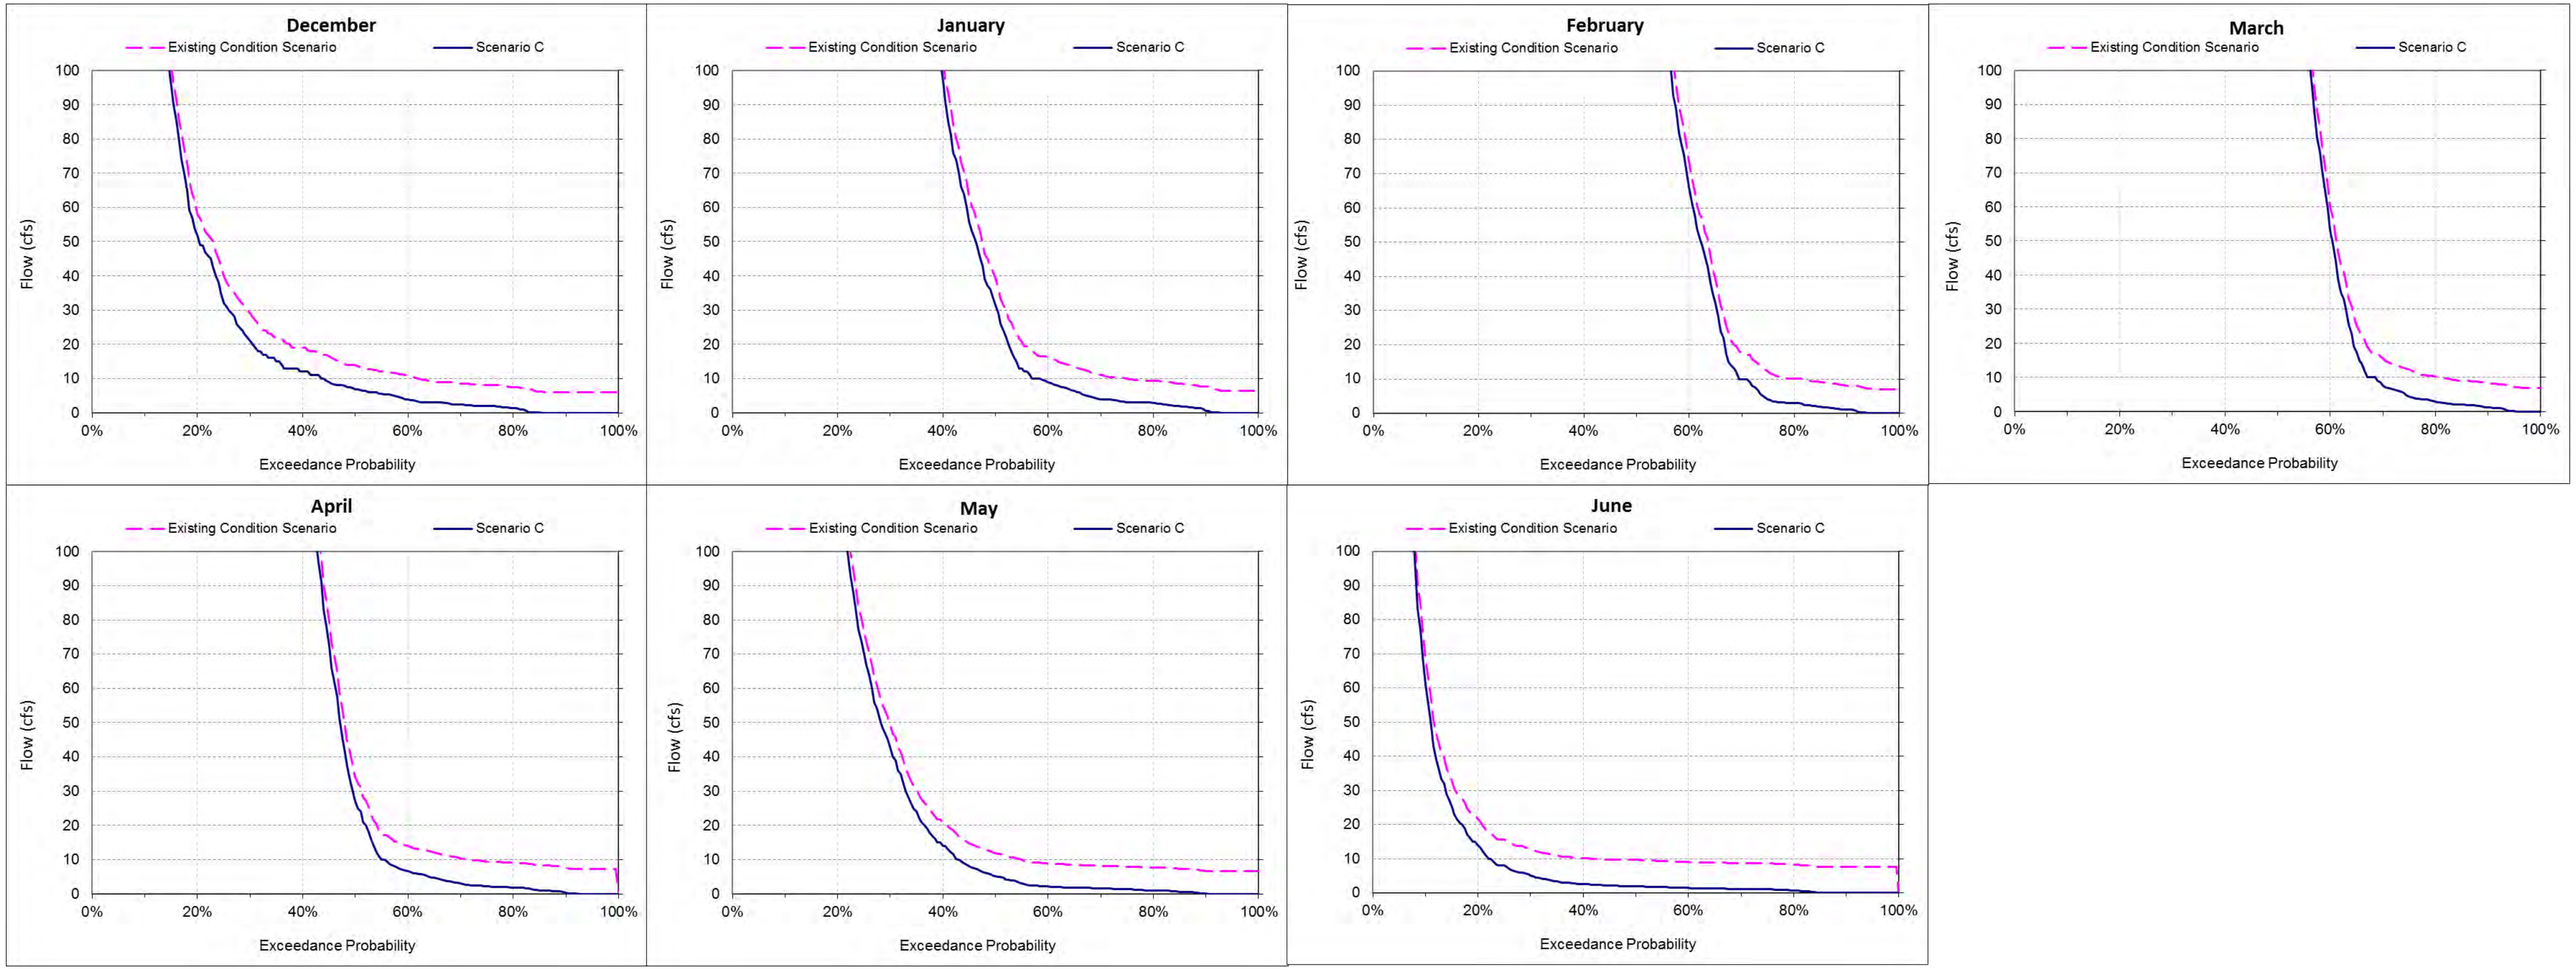

**Figure 3b – Monthly exceedance probability distributions of modeled daily flows for Scenario C, relative to the Existing Condition scenario (y-axis restricted to 100 cfs)**

.

**Table 9 – Percentages of time that modeled flows under Scenario C are less than modeled flows under the baseline condition (the Existing Condition scenario) during both the SCCC steelhead adult immigration period (December through April) and juvenile outmigration period (March through June).**

| Analytical Scenario | December | January | February | March | April | May | June |
|---|---|---|---|---|---|---|---|
| **Percent of time Scenario C has less flow than the Existing Condition Scenario** | 100% | 100% | 100% | 100% | 100% | 100% | 100% |
| **Percent of time Scenario C has slightly less flow than the Existing Condition Scenario (1% < X <10%)** | 12.6% | 24.2% | 26.6% | 28.8% | 25.4% | 21.7 % | 8.9% |
| **Percent of time Scenario C has substantially less flow than the Existing Condition Scenario (X > 10% )** | 82.3% | 56.2% | 40.4% | 40.8% | 54.5% | 73.6 % | 90.4 % |
| **Total Days Modeled** | 2,573 | 2,542 | 2,317 | 2,542 | 2,460 | 2,542 | 2,460 |

**Table 10 – Model results estimates of the number of days and percentage of time represented by those days that diversions under Scenario C caused flows in the Salinas River to be reduced below the adult and juvenile passage thresholds relative to potential number of passage days and baseline conditions.**

| Life stage/ Period | Number of days meeting threshold | | Percent of potential migration period meeting threshold | | Change in percentage of potential migration period meeting threshold (%) | Reduction in number of days meeting threshold relative to baseline | Reduction in threshold occurrence relative to baseline (%) |

## 1.1 Purpose

The Monterey Regional Water Pollution Control Agency (MRWPCA) is preparing an Environmental Impact Report (EIR) for the proposed Pure Water Monterey Groundwater Replenishment Project (GWR Project). The project will develop high quality replacement water for existing urban supplies; and an enhanced agricultural irrigation (Crop Irrigation) component that will increase the amount of recycled water available to the existing Castroville Seawater Intrusion Project in northern Monterey County. The proposed project would consist of source water conveyance facilities, treatment facilities, product water conveyance facilities, and replenishment/recharge facilities. Proposed source waters could include:

- City of Salinas (City) Agricultural wash water currently treated and disposed via evaporation and percolation at the Salinas Industrial Wastewater Treatment Facility;
- Storm water collection systems of the City of Salinas and the Lake El Estero watershed in Monterey; and
- Secondary or tertiary effluent from the Regional Treatment Plant.
- Blanco Drain water;
- Storm water collection systems of other MRWPCA member entities and other watersheds in the Salinas and Monterey areas; and
- Reclamation Ditch / Tembladero Slough water.

Two of these source waters, Blanco Drain water and Reclamation Ditch and Tembladero Slough water, involve potential diversions from surface waters that may support fish fauna or are tributary to waters potentially supporting fish fauna. In this report, Hagar Environmental Science (HES) has evaluated the GWR Projects related flow change effects on fish fauna and associated habitat in the Reclamation Ditch, and Tembladero Slough. Environmental effects of the project on fish fauna related to the Blanco Drain and all other Salinas River areas is treated in a separate report prepared by HDR Engineering, Inc. (2014).

## 1.2 Environmental Setting

The environmental setting for fisheries consists of all aquatic resources that could be directly or indirectly affected by the project. This includes the alternative diversion locations on the Reclamation Ditch near Davis Road and Tembladero Slough at the Castroville Pump Station. The setting also includes downstream aquatic habitats that may be altered by flow modifications including the Reclamation Ditch downstream to its confluence with Tembladero Slough, Tembladero Slough downstream to its confluence with the Old Salinas River channel, and the Old Salinas River downstream to Moss Landing Harbor (Figure 1). Since the project alternatives potentially influence migratory fish including steelhead (*Oncorhynchus mykiss*), the environmental setting also includes the watershed upstream of the Davis Road diversion site.

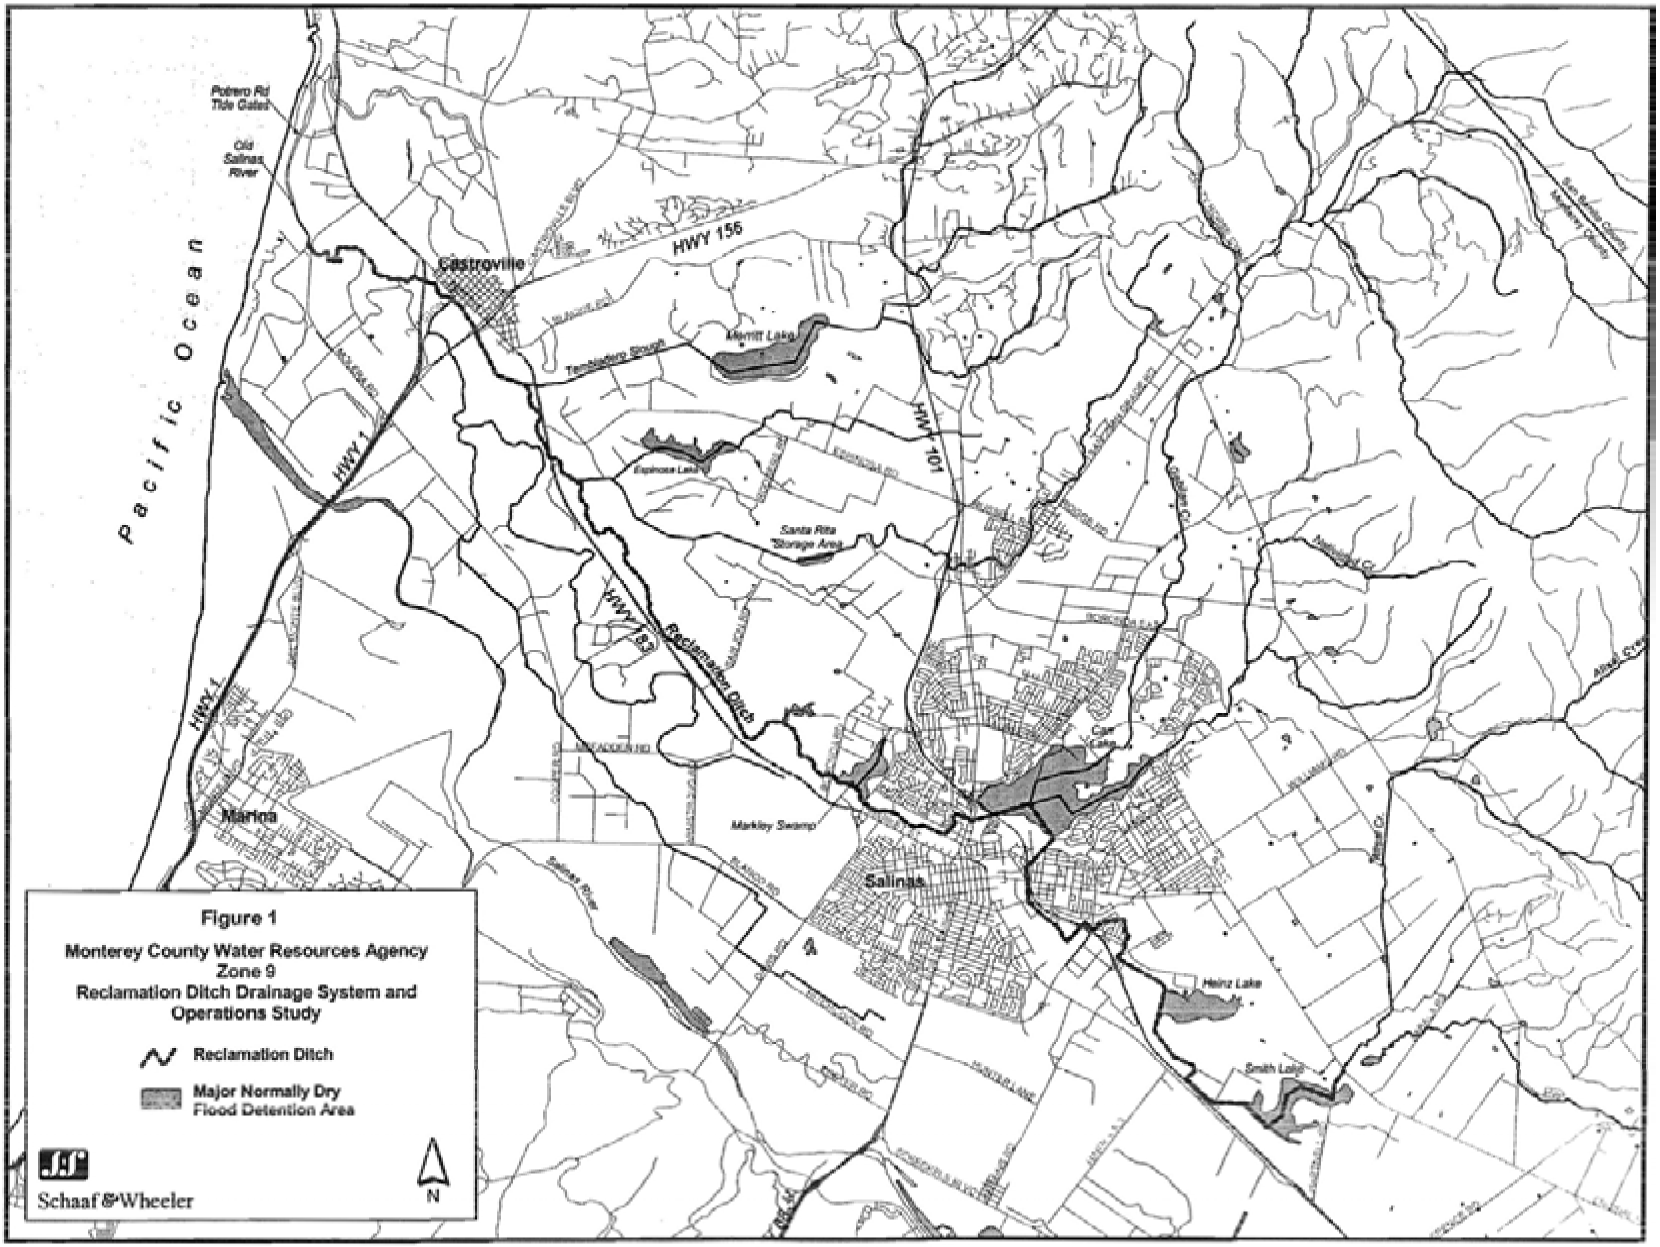

**Figure 1. Project Area.**

### 1.2.1 Reclamation Ditch, Tembladero Slough, and the Old Salinas River

The Reclamation Ditch watershed is approximately 157 square miles with headwaters in the Gabilan Range above Salinas and discharging into the Tembladero Slough then to the Old Salinas River just upstream from Moss Landing Harbor (CCoWS 2006). The lower watershed areas were formerly low lying areas with seasonal lakes, swamps, and wetland. Much of the middle and lower watershed channels have been altered for drainage and conveyance of flood flows. The watershed has five main tributaries including Gabilan Creek, Natividad Creek, Alisal Creek, Santa Rita Creek and the Merritt Lake drainage. Gabilan, Natividad, and Alisal Creeks converge at Carr Lake, a seasonal lake in the center of Salinas, and the outlet from Carr Lake forms the head of the Reclamation Ditch. During the growing season the Carr Lake bed is used for agricultural production (CCoWS 2006). The majority of runoff in the basin was historically generated in the Gabilan and Alisal Creek subwatersheds (CCoWS 2006 reproduced from Cozzens 1944).

The watershed also contains the City of Salinas and portions of Castroville and Prunedale. Summer flows are predominantly agricultural tile drainage. Winter flows include storm runoff from throughout the basin (Schaaf & Wheeler 2014).

The Salinas Reclamation Ditch was built between 1917 and 1920 to collect and drain surface runoff generated in the watershed. It includes the outlet of Carr Lake and a network of channels draining much of the City of Salinas as well as many of the former lakes and sloughs. Urban runoff from the City of Salinas drains into various channels of the Reclamation Ditch system via approximately 54 stormwater outfalls. The whole system drains into Tembladero Slough (an extended brackish, sub-tidal slough), then the Old Salinas River, and ultimately into Moss Landing Harbor through the Potrero Tide Gates (CCoWS 2006).

The Reclamation Ditch system drained an extensive system of interconnected sub-tidal lakes and swamps that formerly existed between Salinas and Castroville. These include Merritt Lake, Espinosa Lake, Santa Rita Slough, Vierra Lake, Fontes Lake, Boronda Lake, Markley Swamp, and Mill Lake (CCoWS 2006). The lakes naturally had poor drainage and were only connected during periods of high runoff. Most of the lakes are now farmed, but still flood regularly during winter storm events and are used for detention flood storage. Following the de-watering of the original lakebeds, land subsidence (Bechtel Corp 1959) of up to several feet was observed resulting in poor natural drainage of surface waters. Surface water pump stations have been installed and operated to allow continued agricultural use of these areas.

The following description of hydrologic conditions in the watershed is drawn largely from CCoWS (2006).

The streams of the Gabilan subwatershed are ephemeral in the upper-most sections, perennial or near-perennial in certain reaches mid-way down the range, and then again ephemeral in the lowest parts of the subwatershed as the streams begin to flow over old alluvium at the foot of the range. Upon entering the broad system of alluvial plains that is the Salinas Valley, most of the streams are ephemeral, sparsely vegetated, relatively small ditches. As they near the Cities of Salinas and Castroville, the ditches converge into wider ditches with perennial standing water in the dry season and storm runoff in the wet season. Water in the dry season is derived from urban runoff, agricultural tailwater, and permitted discharges. Finally, within a few kilometers of the coast, the ditches flow into Tembladero Slough.

#### *1.2.1.1 Channel Conditions*

Channel conditions vary widely in the Reclamation Ditch watershed (CCoWS 2006). At the highest elevations in the Gabilan Range the streams are mostly ephemeral with narrow channels and gentle to moderate gradient. Channel substrate is predominantly gravel and cobble and dominant streamside vegetation is primarily oak savanna with grazed riparian woodland with mixed oak, gray and coulter pines at the highest elevations. Also, there are several seasonal ranch ponds scattered throughout this area, some of which are on-stream. Adjacent land uses are predominantly cattle ranching with State Park lands at the highest elevations (CCoWS 2006).

In the steep mountain canyons of the Gabilan Range, streams are typically narrow and of steep gradient (> 4%). Channel substrate is primarily cobble/boulder. Streams generally flow year-round, especially in the mid to lower elevations of this zone. Riparian vegetation is dense, usually consisting of big-leaf maples, tan oaks, white alder, and sycamore trees. The dense vegetation helps keep the water temperatures cold throughout the year (CCoWS 2006). Adjacent land use is ranching (Casagrande 2001). The presence of pools, large woody debris, such as root wads and downed trees, in addition to cool water temperatures and well-oxygenated flow create suitable habitat conditions for fish (Hager 2001).

In the foothills and alluvial fans of the Gabilan Range, streams are usually ephemeral in some locations with moderate slope (2-4%), smaller average substrate sizes, and shift in riparian species composition from maple and tan oak to willow, box elder, and cottonwood. Riparian vegetation is still commonly found throughout much of the foothill stream reaches, although some reaches have lost a substantial portion of their streamside vegetation (CCoWS 2006). The adjacent land uses are predominantly ranching with some areas developed for row crop agriculture (Casagrande 2001).

Between the foothill zone and the city of Salinas, the stream channels are modified by human development to a greater degree. Some of these still support significant amounts of native riparian vegetation but have been channelized to some extent, thus eliminating the streams ability to fully access the adjacent floodplain during high runoff events. These stream reaches have a gentle slope (< 2%), predominantly sand substrate, and in most areas lack summer flow. Adjacent land use is row-crop agriculture, residential/urban areas, and ranching lands (Casagrande 2001). Some of these stream reaches support native warmwater fish and amphibians. Other stream reaches in this zone have steep banks that are either un-vegetated or support only introduced annual weeds. Such conditions are generally of low habitat quality for riparian-associated organisms, due to the lack of overhead cover, in-channel complexity, and sources of or woody/plant debris. The steep unvegetated banks are also more susceptible to erosion, particularly during high flows. Such bank erosion is a source of sediment that later accumulates in stream channels further downstream.

Most of the stream channels of lower valley bottom have been converted into ditches or drainage canals (Figure 2). These ditches generally have steep side slopes without native riparian vegetation or access to a floodplain, a substrate of primarily fine-grained sediment (mostly silts and clays), and an undefined low-flow channel. The lack of pools and in-stream complexity limits the amount of shelter or overwintering habitat for fish and amphibian species. Sections of the ditch system are occasionally lined with riprap to protect against erosion. Their dry-season flow today is artificially perennial from local urban and agricultural runoff sources (CCoWS 2006). These channels are generally maintained as a drainage canal without tree canopy. The adjacent agricultural lands are used for growing table crops (leafy greens, berries, and artichokes). The growers prevent vegetation from establishing along the Reclamation Ditch banks to discourage birds and rodents from nesting near their fields (Schaaf & Wheeler 2014). Within the City of Salinas, the Reclamation Ditch is an urban watercourse with steep sides and numerous pipe culverts or bridges with lined inverts. (Schaaf & Wheeler 2014). The Reclamation Ditch generally has low gradient though at some locations, particularly bridges, there is a local increase in gradient that presents potential issues for fish migration (Figure 3).

**Figure 2: Reclamation Ditch near Davis Road proposed project site.**

**Figure 3: Reclamation Ditch at San Jon Road and USGS gage weir.**

Downstream of the Highway 183 crossing, the Reclamation Ditch becomes known as Tembladero Slough (Figure 4). At this point the slope flattens significantly, lowering flow velocity and allowing increased sediment deposition (Schaaf & Wheeler 1999). Tembladero Slough is a broad, gentle sloped (< 2%), sinuous channel with slow-moving, perennial flows and fresh water with salinity levels generally lower than 1.5 parts per thousand (ppt) (CCoWS 2006). Riparian vegetation, which is managed by use of herbicides, is sparse, occurring in clusters. Where vegetation is present, it is usually annual weeds along with an occasional clump of willows, tules and/or watercress (CCoWS 2006). Tembladero Slough is tidally influenced from the Old Salinas River up to Highway 183 in Castroville (Schaaf & Wheeler 2014).

**Figure 4: Tembladero Slough at Castroville proposed project site.**

Tembladero Slough joins with the Old Salinas River, which carries the controlled outflow from the Salinas River Lagoon, and together they form a back-beach swale that runs behind the dunes toward Moss Landing Harbor. The Tembladero- Old Salinas River confluence is just downstream of Molera Road and the Old Salinas River flows down through the Potrero Road tide gates to Moss Landing Harbor. This reach also has a gentle slope and meandering channel but is tidally influenced and has brackish water and salt concentration fluctuations due to the tidal cycle (CCoWS 2006). The banks support vegetation tolerant of saltwater, such as pickleweed and/or salt grass. Channel substrate is fine silts and clays.

The Potrero Road tide gates are installed on the Old Salinas River just upstream of Moss Landing Harbor. The tide gates consist of ten box culverts each with a flap gate on the downstream side. During periods of high stream flow and low tide, the gates are opened by the differential water pressure. When the tide is high, the gates close, impeding the flow of the tide up the Old Salinas River. Under conditions of simultaneous high outflows and high spring tides, the gates can impede outflows and increase stage in Tembladero Slough.

#### *1.2.1.2 Streamflow*

The flow regime varies significantly in different parts of the watershed. The hydrology of the study area has been dramatically altered. The impervious area has increased significantly with the expansion of the cities of Salinas and Castroville. Compare flow at the Gabilan Creek Gage (Table 1) just upstream of Salinas with flow at the San Jon Gage, downstream of Salinas (Table 2). The final result in the middle to lower sections of the watershed is that there is less standing water in the dry season, and more runoff in the wet season. The entire system is highly episodic, with little or no flow for most of the time, interrupted occasionally by large runoff events during the wet season (CCoWS 2006). Sources contributing to the stream flow vary seasonally, and include, urban runoff, agricultural tile drain water, and permitted discharge in the dry season and stormwater/urban runoff in the wet season (CCoWS, 2014).

The USGS streamflow gage at San Jon Road (Station 11152650, Reclamation Ditch near Salinas, CA) is located just downstream of the Davis Road proposed diversion site and is relevant for this project. The period of record is 28 years and is split into October 1970 to February 1986 and June 2002 to the present. Measured daily mean discharge at the San Jon Road location ranges from 0 cubic feet per second (cfs) to over 500 cfs and is highest in December through April (Table 2). This seasonal pattern is typical of the Mediterranean climate of Central California.

**Table 1: Summary of Daily Mean Discharge (cfs) by Month for USGS Flow Data, Station 11152600, Gabilan Creek near Salinas, California, for the Period of Record (October 1970 to February 1986, June 2002 to October 2014).**

| Month | Minimum | Average (cfs) | Maximum |
|---|---|---|---|

| Jul | 0.23 | 5.76 | 30.00 |
| Aug | 0.38 | 6.06 | 31.00 |
| Sep | 0.63 | 5.19 | 58.00 |

The Reclamation Ditch is perennial downstream of agricultural and urban development. According to USGS records, flow west of Salinas at the San Jon Road gage only ceased on three days between 1971 and 1985, and on those days, standing water was probably still present throughout most of the Reclamation Ditch (Schaaf & Wheeler 2014). The presence of standing water is reflective of historical conditions, since the area was a system of lakes, while the presence of dry-season flow is a consequence of dry-season urban discharges and agricultural tailwater discharge. Average annual runoff at the San Jon Road gage has declined by almost a third in recent years as water conservation practices have reduced the amount of agricultural irrigation (Schaaf & Wheeler 2014).

There are no instream flow requirements for fisheries or aquatic life in the Reclamation Ditch watershed. There are no known studies that methodically document passage obstacles or barriers in the watershed and no studies of instream flow needs for fish species, including steelhead.

#### *1.2.1.3 Water Quality*

The water quality in the Reclamation Ditch is generally poor, containing high levels of nitrates and pesticides and low levels of dissolved oxygen. The Reclamation Ditch (Salinas Reclamation Canal) and all of its tributary streams are on the California Listing of Water Quality Limited Stream Segments, as reported under Section 303(d) of the Federal Clean Water Act (Central Coast Regional Water Quality Control Board (CCRWQCB 2011). The CCRWQCB Water Quality Control Plan for the Central Coast Basin (Basin Plan) designated beneficial uses of the Reclamation Ditch as including water contact recreation, non-contact water recreation, wildlife habitat, warm water fish habitat and commercial or sport fishing. Tembladero Slough is designated as having additional beneficial uses of estuarine habitat, rare/threatened/endangered species, and spawning/reproduction/early development habitat (CCRWQCB 2011).

The Reclamation Ditch (Salinas Reclamation Canal) and Tembladero Slough are listed as impaired water bodies pursuant to Section 303(d) of the Clean Water Act for ammonia, fecal coliform, pesticides, nitrate, toxicity, dissolved oxygen, and other parameters. Water quality has been sampled and monitored for the past 15 years under various programs, including the Central Coast Ambient Monitoring Program (CCAMP) under the RWQCB, the Central Coast Watershed Studies (CCoWS) program of the Watershed Institute at California State University Monterey Bay, and the Cooperative Monitoring Program under the Conditional Waiver of Waste Discharges from Irrigated Lands (Ag Waiver) (Schaaf & Wheeler 2014). Many of these parameters can be at levels that result in toxicity to aquatic life (CCRWQCB Order No. R3-2012-0011 (Conditional Waiver of Waste Discharge Requirements for Discharges from Irrigated Lands).

### 1.2.2 Fish Fauna

The fish community in the Project Area, and especially in the Reclamation Ditch, has been influenced by habitat alteration during the course of human settlement and development. The fish community, like the Salinas and Pajaro River Watersheds, is similar to and was likely derived from that of the Sacramento/San Joaquin Watersheds (Snyder 1913). There are no known fish surveys of the Reclamation Ditch watershed though anecdotal information (CCoWS 2006) and surveys in nearby water bodies are indicative of species that are likely to be found there (Table 3).

**Table 3. Fish Species Occurring in the Reclamation Ditch Watershed and Vicinity.**

[1] Fish kill in Tembladero Slough reported by CDFG (2002) and various observations by J. Casagrande and J. Hager.
[2] Snyder collections near Salinas, Spreckels, and "Blanco"; Hubbs collections in Salinas River Lagoon.

Based on habitat characteristics it is likely that the headwater perennial streams in the Reclamation Ditch watershed support riffle sculpin (*Cottus gulosus*), speckled dace (*Rhinichthys osculus*), trout (*Oncorhynchus mykiss*), and possibly Sacramento sucker (*Catostomus occidentalis*). Trout have been observed in Gabilan Creek recently (CCoWS 2006) including young trout (1 to 2 inches), along the downstream side of the Old Stage Road Crossing in June 2004 (CCoWS 2006). In early March 2004, a 30-inch adult female steelhead was found dead in Gabilan Creek along Little River Drive (CCoWS 2006). The fish had not spawned and was found at the base of a sediment stabilizer structure. The exact cause of death was not determined but was possibly the lack of suitable flow combined with a possible migration barrier (CCoWS 2006). The fish was found as flows dropped from higher levels on February 25-28 following a storm, and the timing is consistent with a fish attempting to migrate to spawning habitat higher in the watershed.

Although trout have been stocked by landowners in the watershed historically (CCoWS 2006), the presence of suitable habitat in Gabilan Creek, occupied by *O. mykiss* (likely resident life-history form), and the adult steelhead found in 2004 indicate that the Reclamation Ditch watershed should be considered as potential steelhead habitat. Suitable habitat conditions for rainbow trout/steelhead are also likely to exist in the upper reaches of Alisal, Towne, and Mud Creeks (CCoWS 2006).

Spawning habitat is only found within the upper foothill and mountainous reaches of the Gabilan Range where suitable substrate (gravel/cobble) is dominant and stream flow is still abundant (CCoWS 2006). Additionally, the middle reaches of the Reclamation Ditch are characterized by degraded water quality and maintained drainage channels devoid of vegetation that do not provide cover for fish. In order to reach the spawning habitat upstream, steelhead would have to navigate through a series of man-made obstacles. Most are passable during periods of prolonged stream flow to achieve suitable flow depth and duration for passage (CCoWS 2006). The duration of adequate flow in the middle reaches of the Reclamation Ditch Watershed is, in average years, brief and because of this, the migration window is very short (CCoWS 2006). Although the duration of adequate flow in the middle reaches of the Reclamation Ditch Watershed is brief in most years, the distance between Moss Landing Harbor and the upper reaches of Gabilan Creek is not excessive for migrating steelhead.

The middle reaches of the watershed (between the Gabilan Mountains and the City of Salinas) are ephemeral and thus do not support fish. Some intermittent reaches support California roach (*Hesperoleucus symmetricus*) and threespine stickleback (*Gasterosteus aculeatus*) which are both tolerant of high temperature and low dissolved oxygen (CCoWS 2006).

The downstream habitats of the watershed support warm-water fish communities (i.e., minnows, suckers, and introduced fishes). The slow, warmwater habitats of lower Natividad Creek/Laurel Pond, the lower Santa Rita Creek drainage, the Reclamation Ditch, Tembladero Slough, and the Old Salinas River support most of the original native warmwater fish species as well as introduced warmwater species. Species include the native Sacramento sucker, Sacramento blackfish, Sacramento pikeminnow, hitch, California roach, threespine stickleback and a variety of introduced fish like carp, fathead minnow and mosquito fish.

The Salinas River Lagoon fishery has been sampled at intervals since the early 1900's (Snyder 1913, Hubbs 1947) and most recently in the early 1990's (Gilchrist et al. 1997) and in annual surveys by MCWRA from 2002 to 2014 (HES 2014). The fish species assemblage in the Salinas River Lagoon may be representative of other aquatic environments in the lower Salinas Valley including the Old Salinas River Channel and Tembladero Slough. The Lagoon supports a mixed assemblage of marine, freshwater, and estuarine species generally typical of lagoons along the Central California Coast (Table 3). The mix of species in any year is influenced by freshwater inflows, opening and closing of the sandbar at the mouth of the Lagoon, and the resulting conditions of water quality and productivity.

Native freshwater species using the Lagoon included Sacramento blackfish (*Orthodon microlepidotus*), hitch (*Lavinia exilicauda*), Sacramento pikeminnow (*Ptychocheilus grandis*), Sacramento sucker (*Catostomus occidentalis*), prickly sculpin (*Cottus asper*), and threespine stickleback. Several other freshwater species have been collected historically in the Lagoon but are no longer found there. Hubbs collected Sacramento perch from several areas of the Lagoon and recorded speckled dace (*Rhinichthys osculus*) as rare at a single site in the freshwater portion (Hubbs 1947). Thicktail chub (*Gila crassicauda*), an extinct large minnow formerly occupying lowland streams and estuaries, have been well documented at archaeological sites in the Pajaro and Salinas Basins (Gobalet and Jones 1995) and probably occurred in the Salinas River Lagoon. Introduced freshwater species include carp and white bass. The single white bass taken in 1990 probably came from the population in Nacimiento Reservoir and is likely a transient species in the Lagoon. Other reservoir species, such as threadfin shad, may be expected to reach the Lagoon during wet years when large flood control releases are made. In years with low freshwater inflow and saline conditions in the Lagoon, freshwater species may be restricted to the upper reaches of the Lagoon or to freshwater areas upstream of the Lagoon (Gilchrist et al. 1997).

Several marine species use the Lagoon for reproduction or juvenile rearing. Starry flounders spawn in the ocean but juveniles enter the Lagoon and can rear there for two or more years. As they grow older they become less tolerant of fresh water and leave the Lagoon. Staghorn sculpin also enter the Lagoon as juveniles but usually only remain for a year. In 1991, five species of surfperch, both adults and young-of-year, were found in the Lagoon during the summer. Other marine species found include Pacific herring, topsmelt, surf smelt, northern anchovy, jacksmelt, striped bass, and English sole (Gilchrist et al. 1997). The green sturgeon reported by CDFW in 1975 is probably atypical since they usually use larger rivers further north.

### 1.2.3 Sensitive Aquatic Resources

There are two special status fish species that have historically been found in the Lower Salinas River, Salinas River Lagoon, or nearby aquatic environments: the South-Central California coastal steelhead (*Oncorhynchus mykiss*) and the tidewater goby (*Eucyclogobius newberryi*). These species and key life history features are discussed in the following sections. Tidewater goby were first reported from the Lagoon in 1946 but were not recorded there again until 2013 (HES 2014). The Lagoon is important to steelhead in that it may provide rearing habitat for juvenile steelhead under certain conditions and it is the passageway through which spawning adults enter the river and seaward migrating juveniles enter the ocean. Occasional use of the Lagoon by juvenile steelhead has been reported only in recent years (HES 2012, HES 2013, HES 2014). Current water management practices can influence the quality of Lagoon habitat and the ability of steelhead to move between the Lagoon and the ocean.

#### *1.2.3.1 South-Central California Coastal Steelhead*

NMFS listed the South-Central California Coast steelhead (SCCC steelhead) as threatened in 1997 (62 FR 43937) and affirmed the listing in 2006 (71 FR 834). In September 2012, NMFS completed a 5-year status review of the SCCC steelhead Distinct Population Segment (DPS). Based upon a review of available information, NMFS (2011) recommended that the SCCC steelhead DPS remain classified as a threatened species. The SCCC steelhead DPS includes all naturally spawned anadromous populations of *O. mykiss* in coastal river basins from the Pajaro River in Monterey County southward to but not including the Santa Maria River in San Luis Obispo County (65 FR 36074, 71 FR 834). Although *O. mykiss* exhibits both resident and anadromous life history characteristics, the SCCC steelhead DPS includes only the anadromous life form of *O. mykiss*.

#### *Critical Habitat Designation*

Critical Habitat for SCCC steelhead was designated in February 2000 (65 FR 7764) and was reaffirmed in 2005 (70 FR 52488). Section 3 of the ESA (16 U.S.C. 1532(5)) defines critical habitat as ‘‘(i) the specific areas within the geographical area occupied by the species, at the time it is listed on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protection; and (ii) specific areas outside the geographical area occupied by the species at the time it is listed. The freshwater primary constituent elements of critical habitat include: 1) spawning habitat, including spawning substrate, and adequate water quantity and quality; 2) freshwater rearing habitat including floodplain connectivity, and natural escape and velocity cover; and 3) freshwater migration corridors free of obstructions, with water quantity and quality conditions that allow movement" (NMFS 2005, MCWRA 2013).

The Critical Habitat designation includes Gabilan Creek, the Reclamation Ditch, Tembladero Slough, the Old Salinas River and Salinas River Lagoon, and Lower Salinas River. The primary constituent element of critical habitat that could potentially be affected by the Proposed Project is migration habitat in the Reclamation Ditch, Tembladero Slough and Old Salinas River.

***Life History Overview***

Steelhead/rainbow trout have a very flexible life history. *O. mykiss* that migrate to the ocean (anadromous) undergo physiological changes in the process of smoltification that allow them to adapt to seawater. These fish, commonly referred to as steelhead, spend a variable amount of time in the ocean, typically one to two years, grow rapidly and return to spawn, generally in the stream where they hatched. Some *O. mykiss* within any given stream, and the proportion may vary considerably depending on local circumstances, do not migrate to the sea. These fish reach sexual maturity and spawn without entering the ocean and are often known as resident or stream rainbow trout. They mature at smaller sizes than sea-run steelhead and produce fewer eggs. Resident *O. mykiss* can persist for generations in locations where migration to sea has been precluded such as above landslides and dams and during extended droughts. There are a number of documented life-history strategies that are intermediate between resident populations and fully anadromous populations. Intermediate life-history patterns include fish that migrate within the stream (potadromous), fish that migrate only as far as estuarine habitat, and fish that migrate to near-shore ocean areas. These life-history patterns do not appear to be genetically distinct, and have been observed interbreeding (Shapovalov and Taft 1954, Barnhart 1986, Pearcy 1992, Busby et al. 1996, Hayes et al. 2011).

There are selective advantages to both anadromous and resident strategies (Cramer et al. 1995). Anadromous fish grow faster and reach a larger size thereby gaining a potential to produce more offspring than resident fish. At the same time, however, migratory fish are exposed to many sources of mortality and there is a risk that conditions may become unsuitable for migration, particularly in California where fluctuating climatic conditions can result in long periods when streams have tenuous connection to the ocean. In California, many streams support both resident and anadromous forms with no observable genetic differentiation. During extended drought periods it is possible for populations to sustain themselves through resident spawning and then revert to an anadromous life history when suitable conditions return. Presence of resident rainbow trout populations tends to increase in the southern part of the range (Cramer et al. 1995). Rainbow trout observed in freshwater habitat may be the offspring of either anadromous or resident fish; it is not possible to distinguish them based on external observation.

All steelhead within the SCCC steelhead DPS are considered "winter steelhead" based on their migratory timing and behavior. They ascend streams during the winter when winter rainfall results in suitable flow and temperature (Busby et al. 1996, Moyle 2002). Steelhead along the Central California coast enter freshwater to spawn when winter rains have been sufficient to raise streamflows and breach the sandbars that form at the mouths of many streams during the summer. Increased streamflow during runoff events also appears to provide cues that stimulate migration and allows better conditions for fish to pass obstructions and shallow areas on their way upstream. The season for upstream migration of steelhead adults lasts from late October through the end of May but typically the bulk of migration (over 95% in Waddell Creek) occurs between mid-December and mid-April (Shapovalov and Taft 1954, NMFS 2007). Steelhead are unique among the other Pacific salmonids in that they do not all die after spawning. Some return immediately to the ocean (generally by the late spring but dependent on runoff conditions), others return after holding for a period in freshwater.

Steelhead have strong swimming and leaping abilities that allow them to ascend streams into small tributary and headwater reaches. Steelhead can swim at rates of up to 4.5 feet per second (fps) for extended periods of time and can achieve burst speeds of 14 to 26 fps during passage through difficult areas (Bell 1986). Leaping ability is dependent on the size and condition of fish and hydraulic conditions at the jump. Given satisfactory conditions, a conservative estimate of steelhead leaping ability is a height of 6 to 9 feet (Bjornn and Reiser 1991), though other estimates range from 11 feet (Bell 1986) to as high as 15 feet (McEwan 1999).

*O. mykiss* select spawning sites with gravel substrate and with sufficient flow velocity to maintain circulation through the gravel and provide a clean, well-oxygenated environment for incubating eggs. Preferred flow velocity is in the range of 1-3 feet per second (Raleigh et al. 1984) and preferred gravel substrate is in the range of 0.25 to 4 inches in diameter for steelhead and 0.25 to 2.5 inches for non-anadromous rainbow trout (Bjornn and Reiser 1991). Typically, sites with preferred features for spawning occur most frequently in the pool tail/riffle head areas where flow accelerates out of the pool into the higher gradient section below. In such an area, the female will create a pit, or redd, by undulating her tail and body against the substrate. This process also disturbs fine sediment in the substrate and lifts it into the current to be carried downstream, cleaning the nest area. Incubation and emergence success are influenced by accumulation of fine sediments (less than 3.3 mm) in the substrate. Embryo survival for steelhead decreases when the percentage of substrate particles less than 6.4 mm reaches 25-30% and is extremely low when fines are 60% or more. Emergence of steelhead fry is generally high when fine sediments are less than 5% of substrate volume but drops sharply with fine sediment volume of 15% or more (Bjornn and Reiser 1991).

*O. mykiss* hatch in the gravel-cobble substrate of the streambed. After two to three weeks the young fry emerge from the gravel and begin to feed in the stream. Some begin to disperse downstream in the months following their emergence but the rest continue to rear in the stream for a period of up to a few years (Shapovalov and Taft 1954). After emergence from the gravel, fry inhabit low velocity areas along the stream margins. As they feed and grow they gradually move to deeper and faster water (Bjorkstedt et al. 2005). Cover in the form of fallen trees, roots, undercut banks, boulders, and overhanging vegetation are important components of rearing habitat. Heads of pools generally provide classic conditions where trout can hold in lower velocity areas as currents bring food from the riffles upstream. Often, local populations thrive under conditions that may depart widely from species norms (Behnke 1992). Trout can inhabit quite small streams, particularly in coastal streams. Often habitat may be far more limiting for older juveniles than habitat for younger fish. The critical period is during base flow conditions that generally occur between May and October in Central California. Streamflow can drop to very low levels with loss of depth and velocity in riffle and run habitats, or in the extreme, only isolated pools with intervening dry sections of stream. Any diversion or other depletion of streamflow during this critical period can be potentially damaging to rearing juvenile steelhead. During winter as water temperatures decrease and flows increase, juveniles seek hydraulic refuge within pools, interstitial spaces in cobble and boulder substrates, or near large woody debris (MCWRA 2013).

Temperature is an important factor for *O. mykiss*, particularly during the over-summer rearing period. In many Central California streams growth slows or ceases in conjunction with warm, low flow conditions in late summer. Upper incipient lethal temperature for Pacific salmonids is in the range of 75°F to 77°F (24ºC to 25ºC) for continuous long-term exposure (Brett 1952; Brett et al. 1982). Elevated temperature below the lethal threshold can have indirect influence on survival due to depression of growth rate, increased susceptibility to disease, lowered ability to evade predators, decreased migratory behavior, and influences on smoltification (Zaugg and Wagner 1973, Adams et al. 1975). Preferred temperatures for steelhead parr range from 54°F to 64°F (12ºC to 18ºC), although optimum growth rates may occur at slightly higher temperatures if food is abundant (Smith 1999, Hokanson, et al. 1977, Myrick and Cech 2005). Behnke (1992) has found native redband trout in intermittent desert streams thriving in water of 83°F (28ºC) and actively feeding at that temperature. These populations have apparently become adapted to conditions in the region.

During the dry season a lagoon forms at the mouths of many California coastal streams. Lagoon habitat has been shown to be very important for rearing juvenile steelhead. Smith (1990) estimated that relatively large numbers of juvenile steelhead were present in San Gregorio, Pescadero, and areas, particularly larger individuals; that juvenile steelhead that rear in the lagoon experience higher growth rates than stream-reared fish; and that lagoon-reared fish comprise a high percentage of returning adult steelhead. Similarly, Bond (2006) found both high growth rates and high rates of return for estuary-reared steelhead in Scott Creek. Bond calculated that estuary-reared steelhead comprised between 8% and 48% of all downstream migrating juveniles but 85% of the returning adult population. Juvenile *O. mykiss* can migrate downstream to a lagoon at almost any point from the time they emerge from the gravel until they migrate to sea as smolts. Some *O. mykiss* rear in a lagoon until maturity and return upstream to spawn without entering the ocean.

After 1 to 3 years of rearing in freshwater, whether in the stream or in a lagoon, anadromous *O. mykiss* undergo the process of smoltification and enter the ocean. Seaward migration of smolts occurs primarily in the late-winter or spring, typically in March through late-May (Shapovalov and Taft 1954, Hayes et al. 2011). These fish may reside in the ocean for between 2 and 4 years (Barnhart 1986, Moyle 2002) prior to returning to spawn. Migrating smolts require adequate flows for passage and downstream movement, suitable temperature and water quality conditions, and cover from predators (NMFS 2007). Increased flow provides greater depths, currents, and surface turbulence all of which help to increase travel rates and survival of smolts (NMFS 2007)

Habitat conditions for steelhead in the Salinas Basin are distinct from most other streams in the South-Central California Coast (MCWRA 2001). The Salinas River drains an inland valley separated from the ocean by the coastal mountains. The Salinas Valley is expected to have significant differences in rainfall, air temperature, vegetation, and summer fog. These in turn are expected to influence steelhead habitat conditions including stream temperature during the summer rearing periods and the duration and frequency of streamflow conditions suitable for migration (NMFS 2007). Steelhead in the Salinas River may experience a greater number of years when access to the ocean is not possible due to low streamflow. Migration of adults from the ocean may begin later in the season, and seaward migration of juveniles may be truncated in the spring as compared to the other coastal drainages (MCWRA 2001). Climate conditions in the Reclamation Ditch watershed, located in the far northern part of the Salinas Valley and close to Monterey Bay, may be somewhat moderated in this respect.

### *1.2.3.2 Tidewater Goby*

#### *Status and Distribution*

Tidewater goby (*Eucyclogobius newberryi*) are a small, short-lived California endemic species that inhabits coastal brackish water habitats entirely within California, ranging from Tillas Slough (mouth of the Smith River, Del Norte County) near the Oregon border south to Agua Hedionda Lagoon (northern San Diego County) (Figure 5). Tidewater goby are currently listed as endangered under the Federal ESA (59 FR 5494) but have been proposed for reclassification as threatened (79 FR 14340). Tidewater goby are considered to be a species with moderate threats and a high potential for recovery (USFWS 2005). Tidewater goby has had fully protected status from the State of California since 1987.

Hubbs (1947) reported collecting tidewater goby in low to moderate abundance at three locations in the Salinas River Lagoon in August 1946. Tidewater gobies were recently collected again there in 2013 (HES 2014). Tidewater goby have also been found in Bennett Slough (northern end of Elkhorn Slough) (USFWS 2005). The critical habitat designation for tidewater goby includes Bennett Slough (north of the project area) and the Salinas River (USFWS 2013).

#### *Life History*

Tidewater goby are uniquely adapted to coastal lagoons and the uppermost brackish zone of larger estuaries, rarely invading marine or freshwater habitats (USFWS 2005). Tidewater gobies are small fish (rarely exceeding two inches in length) that generally live for only 1 year, with few individuals living longer than a year (Moyle 2002 cited in USFWS 2005). Reproduction occurs at all times of the year, as indicated by female tidewater gobies in various stages of ovarian development (Swenson 1999 cited in USFWS 2005). The peak of spawning activity occurs during the spring and then again in the late-summer. Fluctuations in reproduction are probably due to death of breeding adults in early summer and colder temperatures or hydrological disruptions in winter (Swift et al. 1989 cited in USFWS 2005). Reproduction takes place in water between 48°F and 77°F (9°C and 25°C) and at salinities of 2 to 27 ppt (Swenson 1999 cited in USFWS 2005).

Male tidewater gobies begin digging breeding burrows in relatively unconsolidated, clean, coarse sand (averaging 0.5 millimeter [0.02 inch] in diameter), in April or May after lagoons close to the ocean (Swift et al. 1989; Swenson 1995 cited in USFWS 2005). Swenson (1995 cited in USFWS 2005) has shown that tidewater gobies also prefer this substrate in the laboratory. Burrows are at least 70 to 100 millimeters (3 to 4 inches) from each other. After hatching, the larval tidewater gobies, measuring 4 to 5 millimeters (mm) in standard length (SL), emerge from the burrow and swim upward to join the plankton (Wang 1986, Swift et al. 1989). Juvenile tidewater gobies become benthic dwellers at 16 to 18 mm SL (Moyle 2002). Tidewater gobies are known to be preyed upon by native species such as small steelhead, prickly sculpin, and staghorn sculpin (Swift et al. 1989 cited in USFWS 2005).

**Figure 5: Tidewater goby, Salinas River Lagoon, October 2013. (*photo J. Hagar*)**

Tidewater goby abundance fluctuates spatially and seasonally, due in part to their predominantly annual life cycle (Swenson 1999). Tidewater goby populations also vary greatly with the varying environmental conditions (e.g., drought, El Niño) among years (USFWS 2007). This environmental variation is a normal phenomenon, but one that makes the determination of trends in population size difficult. For example, tidewater goby populations decrease during the rainy season when lagoons are open and influenced by flood events, and then recover during the following summer (USFWS 2007). Swift et al. (1989) estimated that individual tidewater gobies within a population at Aliso Creek Lagoon ranged from 1,000 to 1,500 in the late winter-early spring and 10,000 to 15,000 tidewater gobies in the late summer-early fall.

Their short life span and restricted habitat make individual populations vulnerable to unique catastrophic events (floods, toxic events, introduction of predator species, drought, or habitat alteration). Nevertheless, available information indicates that *Eucyclogobius* is tolerant of a very wide range of salinity, temperature, and other water quality conditions.

The USFWS characterizes tidewater goby populations (i.e., localities) along the California coast as metapopulations (a group of distinct populations that are genetically interconnected through occasional exchange of animals) (USFWS 2007). While individual populations may be periodically extirpated under natural conditions, a metapopulation is likely to persist through colonization or re-colonization events that establish new populations (USFWS 2007). Local populations of tidewater gobies occupy coastal lagoons and estuaries that in most cases are separated from each other by the open ocean. Very few tidewater gobies have ever been captured in the marine environment (Swift et al. 1989), which suggests this species rarely occurs in the open ocean (USFWS 2007). Some tidewater goby populations persist on a consistent basis (potential sources of individuals for re-colonization), while other tidewater goby populations appear to experience intermittent extirpations. Local extirpations may result from one or a series of factors, such as the drying up of some small streams during prolonged droughts, water diversions, and estuarine habitat modifications (USFWS 2007). Some localities where tidewater gobies have been extirpated apparently have been re-colonized when extant populations were present within a relatively short distance of the extirpated population (i.e., less than 6 miles (10 kilometers)). More recently, another tidewater goby researcher has suggested that re-colonizations have typically been between populations separated by no more than 10 miles (16 kilometers) (Swift 2007 cited in USFWS 2007). Flooding during winter rains can contribute to re-colonization of estuarine habitats where tidewater goby populations have previously been extirpated. The closest known populations that could recolonize the Salinas River Lagoon are in the Pajaro River and Elkhorn Slough (USFWS 2005, Kukowski 1972, Swift et al. 1989). The mouth of Elkhorn Slough is connected to the Salinas River Lagoon through the Old Salinas River. The mouth of the Pajaro River is about 3 miles (5 kilometers) north of the mouth of Elkhorn Slough and about 7 miles (11 kilometers) north of the Salinas River Lagoon.

***Habitat Characteristics***

The tidewater goby favors the calm conditions that prevail when the lagoons are cut off from the ocean by beach sandbars. They are bottom dwellers and are typically found at water depths of less than 3 feet. Tidewater gobies typically inhabit areas of slow-moving water, avoiding strong wave action or currents. Particularly important to the persistence of the species in lagoons is the presence of backwater, marshy habitats, which provide refuge habitat during winter flood flows (J. Smith pers. comm. 1999 as referenced in Environmental Science Associates 2001). Optimal lagoon habitats are shallow, sandy-bottomed areas 20 to 10 cm deep, surrounded by beds of emergent vegetation. Open areas are critical for breeding, while vegetation is critical for overwintering survival (providing refuge from high flows) and probably for feeding as well (Moyle 2002).

Swift et al. (1989) found that all sizes of *E. newberryi* usually occur at the upper end of lagoons at salinities of 10 ppt or less. Of 60 collections, 65% were at 0-10 ppt, 20% were at 10-20 ppt, 17% at 20-30 ppt, and 2% at 42 ppt. The collection at 42 ppt was made at Bennett Slough, a tributary of Elkhorn Slough in Monterey County (Swift et al. 1989). In lab tests conducted by the CDFW, tidewater gobies were maintained in freshwater, 10-15 ppt, 20 ppt, and normal seawater (33 ppt) with reproduction taking place under all four conditions (Worcester and Lea 1996). Differences in reproductive success, if any, were not reported. Worcester and Lea also held tidewater gobies in hypersaline water (45-54 ppt) for 6 months with no mortality. Holding temperatures during these tests ranged from 39°F to 71°F (4.0°C to 21.5°C). In salinity tolerance tests reported by Swift et al. (1989), tidewater gobies in salinities above 41 ppt experienced high mortality. In an experiment where salinity increased slowly due to evaporation, over half the gobies survived hypersaline conditions up to 1.75 times that of seawater.

Swift et al. (1989) list several criteria for lagoon conditions that favor tidewater gobies. These include: little or no channelization; allowing closure to the ocean for much of the year so that tidal fluctuation is absent or minimal; fresh unconsolidated sand is optimal for reproduction; high quality of inflowing water to increase habitable area of a lagoon in summer. Nutrient enrichment can stimulate algal blooms, deplete oxygen, and lead to hydrogen sulfide formation. Most fish species are intolerant of low dissolved oxygen and high hydrogen sulfide concentrations. Introduced predatory fish should be excluded. Centrarchid fish (sunfish and bass) and tidewater gobies are not usually found together and may not be able to coexist (Swift et al. 1989).

Gobies may move upstream during winter rains and high flows of inlet streams (Swift et al. 1989) as well as during the summer when algal blooms and hydrogen sulfide forms in the substrate and enters the water column. During this period most fish are at the upper end of lagoons where freshwater inflow occurs or at the seaward end where occasional waves wash into the Lagoon (Swift et al. 1989).

Currently, the majority of the most stable and largest tidewater goby populations consist of lagoons and estuaries of intermediate sizes (5 to 125 acres or 2 to 50 hectares) that have remained relatively unaffected by human activities (USFWS 2005). Many of the localities where tidewater gobies are regularly present may be “source” populations for localities that intermittently lose their tidewater goby populations. Large wetlands are likely to have lower rates of extirpation than small wetlands. In addition, populations at small sites were sensitive to drought, presumably because droughts can eliminate suitable habitat at small wetlands (USFWS 2007).

## 1.3 Effects Assessment

### 1.3.1 Significance Thresholds and Evaluation Criteria

The California Environmental Quality Act (CEQA) Guidelines provide a discussion of significance criteria for evaluation of environmental effects of a project. Appendix G of the CEQA Guidelines suggests the following evaluation criteria for biological resources:

Would the project:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;
- Conflict with any local policies or ordinances protecting fishery resources; or
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan.

In order to apply these general criteria to any particular project, it is helpful to identify specific, measurable, indicators that can be used to compare baseline (without project) conditions for potentially effected resources to conditions that are expected to occur with the project or various alternatives.

The GWR project would potentially alter habitat conditions by changing flow patterns. Flow would be diverted at certain locations and times in varying amounts. This would also require construction of facilities to divert and conduct flows to desired locations. Therefore, indicators for this assessment are primarily related to changes in flow. It is important that impact analyses include assessment of components of the flow regime that can be used to characterize the entire range of flows and specific hydrologic phenomena (e.g., floods and low flows) that are vital to the integrity of river ecosystems, and thus fish species. These components of the flow regime include: (1) magnitude; (2) frequency; (3) duration; (4) timing; and (5) rate of change of hydrologic conditions (Poff et al. 1997). Furthermore, Poff et al. (1997) report that by defining flow regimes in these terms, the ecological consequences of particular human activities that modify one or more components of the flow regime can be considered explicitly. Therefore, effects analysis for the GWR project relied heavily on evaluating changes to the hydrographs caused by project water diversions.

In order to identify potential effects of the Project's Diversion Scenarios on stream flow, a 10 percent decrease in flow relative to existing conditions was defined as a relevant indicator of potential effects. A decrease in flow of 10 percent or greater during a relevant evaluation period has been previously identified by various environmental documents as an appropriate criterion to evaluate flow changes (USFWS et al. 1999, USDOI et al. 1999, JSA 2003).

Accordingly, evaluation of the GWR project relies on previously established information and uses changes in flow of 10 percent or greater, as expressed by flow exceedance probabilities, as an indicator of potential effects on riverine habitat. Further, since SCCC steelhead are the only protected species using riverine portions of the project area (tidewater goby are an estuarine species), additional analysis was developed for this species.

Migration, both upstream for adults and downstream for adults (kelts) and juveniles (smolts) are the potentially affected steelhead life stages. Potential project affects to these life stages are related to changes in flows resulting from each of the different Diversion Scenarios. This analysis used previously established minimum flow thresholds for steelhead migration to assess changes in the duration of periods available for migration. Modeled hydrologic data reflecting project operations scenarios was used to evaluate the amount of time project flows were in a range suitable for migration and this was compared to the amount of time flow is in a suitable range under baseline conditions.

For the purposes of this analysis, the effect of a Diversion Scenario would be considered less than significant if it would result in either of the following:

- A change in stream flow during relevant analytical periods of less than 10%.
- A change in frequency of occurrence of flow at or above migration thresholds of less than 10%, relative to specific flow thresholds during steelhead adult or smolt migration periods.

A change in streamflow of 10% or more may or may not be considered significant depending on the species and lifestages likely to be present, habitat requirements and behavior of those species or lifestages, and potential for the given flow change to influence key habitat features. Furthermore, for an impact to be considered less than significant, implementation of a Diversion Scenario will not cause creation of an obstacle or hazard to migrating steelhead (adults, juveniles or smolts) or other native resident or migratory fish.

Five diversion scenarios (Cases) are evaluated:

- Case 0: Base Condition Flow = USGS San Jon Road gage (11152650), scaled down by a factor of 0.937 for Davis Road location and scaled up by a factor of 1.4 for Castroville location.
- Case 1: Divert up to 2.99 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville; leave a minimum base flow of 2 cfs December-May, or 0.69 cfs June-November at Davis Road location and leave constant minimum base flow of 1 cfs in Tembladero Slough.
- Case 2: Divert up to 6.0 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville; leave minimum base flows of 2 cfs December-May, or 0.69 cfs June-November at Davis Rd location and leave constant minimum base flow of 1 cfs in Tembladero Slough.
- Case 3: Divert up to 2.99 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville; leave minimum base flows of 1.0 cfs year-round in both Tembladero Slough and Reclamation Ditch.
- Case 4: Divert up to 6.0 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville; Leave minimum base flows of 1.0 cfs year-round in both Tembladero Slough and Reclamation Ditch.

### 1.3.2 Construction Related Effects

#### *1.3.2.1 All Cases*

The diversion facility would include an inlet consisting of a concrete box with a screened inlet in the channel bottom (Schaaf & Wheeler 2014). The inlet structure would measure a minimum of 4-ft. wide by 6-ft. long and the channel invert would be concrete lined with a permanent low-flow channel adjacent to the inlet. This would prevent capturing the required minimum by-pass flows. The channel banks above the inlet structure would be protected with grouted rip-rap to prevent scour and potential bank sloughing into the by-pass and inlet (Schaaf & Wheeler 2014). Dewatering the channel to complete construction of the in-channel structures would represent a short-term temporary impact to aquatic habitat and aquatic species within the construction area. Effects could be avoided and minimized to less than significant levels by completing the work during the low flow season when migratory steelhead would not be present. Best management practices (BMPs) including removal of fish and other aquatic species prior to construction would minimize effects on aquatic habitat or species to less than significant levels. Tidewater goby are not expected to be present at the Davis Road site due to its degraded condition and distance upstream from estuarine habitat. There is a potential for tidewater goby to be present at the Castroville site. Preconstruction surveys would be completed to determine whether tidewater goby are present at the site and if so, consultation with the USFWS would be required to determine appropriate avoidance and minimization measures.

### 1.3.3 Operation- Effects of Diversion Structures

#### *1.3.3.1 All Cases*

The inlet would be screened to minimize entrainment of fish (Schaaf & Wheeler 2014). The screening system would be in compliance with Statewide Fish Screening Policy (http://www.dfg.ca.gov/fish/Resources/Projects/Engin/Engin_ScreenPolicy.asp) and Fish Screening Criteria developed by CDFW for structure placement, approach velocity, sweeping velocity, screen openings, and screen construction (http://www.dfg.ca.gov/fish/Resources/Projects/Engin/Engin_ScreenCriteria.asp).

The Statewide Fish Screening Policy is structured to comply with existing fish screening statutes, the National Environmental Policy Act (NEPA), CEQA, the Federal Endangered Species Act (ESA), the California Endangered Species Act (CESA), and court decisions in place at the time of its adoption.

Compliance with these policies and criteria would reduce potential effects of the diversion structure to less than significant levels. Due to the possibility of migrating steelhead in Tembladero Slough and the Reclamation Ditch, facilities in those locations would also be in compliance with NMFS Anadromous Salmonid Passage Facility Design criteria and specifications (NMFS 2008). Compliance with these policies and criteria and would reduce potential effects of the diversion structure to less than significant levels.

### 1.3.4 Operation- Alteration of Flows

Potential project effects on flows were determined by comparing estimated flows with the project to present conditions for each Case. Modeled flow results are used for comparative purposes, rather than for absolute predictions, and the focus of the analysis is on comparative differences between the scenarios (e.g., a comparison of estimated conditions under Case 1, relative to conditions without the project). All of the assumptions (e.g., hydrologic conditions, climatic conditions, upstream storage conditions, etc.) are the same for both the with-project and without-project flow estimates, except assumptions associated with the diversion Case itself, and the focus of the analysis is the differences in the results.

Flow data used in these analyses were provided by Schaaf & Wheeler. The analyses use

USGS gaged flow from the San Jon Road gage (Station 11152650, Reclamation Ditch near Salinas, CA). The gage is located just downstream of the Davis Road proposed diversion site and is relevant for this project. The period of record is 28 years and is split into October 1970 to February 1986 and June 2002 to the present. Average annual runoff at the San Jon Road gage has declined by almost a third in recent years as water conservation practices have reduced the amount of agricultural irrigation (Schaaf & Wheeler 2014). Therefore, only the 2002-2013 data were used in this analysis. The years in this limited data set have mean annual flows with a higher minimum, lower maximum, and lower average than the longer data set.

Changes in flow were estimated for both the Davis Road proposed project site and the Castroville proposed project site. Schaaf & Wheeler calculated the sub-basin sizes for the entire Reclamation Ditch watershed (Schaaf & Wheeler 2014). Based on those data, the basin size above the USGS gage is 109.4 square-miles. The drainage basin above the proposed diversion point on the Reclamation Ditch at Davis Road is 102.5 square-miles, or 93.7% of the gaged area. Historic mean daily flows at the diversion point were calculated by scaling the recorded flows at San Jon Road by that factor. For alternatives at the Castroville proposed project site (Case 3 and 4), the gaged flow record from the San Jon Road gage was also used; however, since the drainage basin above the MRWPCA Castroville Pump Station is 148.5 square-miles, or 136% of the gaged area, the historic mean daily flow records were scaled by 136%.

Daily estimated flow data were used to develop exceedance probability distributions (exceedance curves) by three separate seasonal periods including: adult steelhead upstream migration (December through April), steelhead smolt migration (March through May), and dry season (June through September). These exceedance probability distributions were developed from ranked and sorted data, and show the percentage of time (probability) that a given value is exceeded. These curves show the differences in general long-term flow patterns between the base Case and each of four alternative diversion scenarios.

Effects of the project on steelhead migration were assessed by calculating changes in periods of time when flows are sufficient to allow migration. Minimum flows for migration of both adult steelhead moving upstream to spawn and smolts moving downstream to the ocean were determined through site specific studies in the Reclamation Ditch (HES 2015). Minimum passage flow thresholds were estimated at two critical passage sites: the USGS stream gage weir at San Jon Road and at a site near Boronda Road (Table 4). Flow thresholds for steelhead passage were estimated from measured channel geometry and application of the Manning equation (HES 2015). Due to error inherent in the method for obtaining these estimates, the accuracy of the threshold estimates is assumed to be no better that +/- 30% (HES 2015). Estimates of the number of days when stream flow equaled or exceeded these thresholds during the appropriate migration season were calculated for the Base Case and each of the diversion Cases. Migration seasons were defined to encompass the major period for each life stage typical of the Salinas River basin: December through April for adults and March through May for smolts. Although migration can occur outside these windows under some conditions, expanding the analytical period can minimize the potential effects by including greater time periods with low potential for occurrence of the species (e.g. a change of 10 days of suitable passage would be considered significant over a 90 day migration season but not over a 120 day season). For adult migration the migration season is designated by the year it ends (e.g. the 2003 migration season starts December 1, 2002 and ends April 30, 2003.

**Table 4: Minimum Passage Flow Estimates for Steelhead Migrating Through the Reclamation Ditch Downstream of Davis Road *(Source: Hagar Environmental Science 2015).***

| Location | Adult | Smolt |
|---|---|---|
| San Jon Road (USGS gage weir) | 78 cfs | 31 cfs |
| Boronda Road critical riffle | 32 cfs | 11 cfs |

*1.3.4.1 Case 1*

***Divert up to 2.99 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville with minimum bypass flow of 2 cfs December-May and 0.69 cfs June-November at Davis Road location and 1 cfs in Tembladero Slough.***

For Case 1 during the adult migration period, the largest proportional flow reductions downstream of Davis Road would occur when Base Case flow is in the range of 1 to 30 cfs (Figure 6). Flow reductions for base case flows over 30 cfs would be 10% or less. The 2.99 cfs diversion at Castroville under Case 1, combined with the Davis Road diversion, results in larger flow reductions in Tembladero Slough and downstream reaches to Monterey Bay with flow reductions of 10% or more for Base Case flows of 1 to 60 cfs (Figure 7).

Steelhead are most likely to migrate during high flows that occur during winter storm runoff. Minimum migration flows for adult steelhead passage in the Reclamation Ditch have been estimated at 32 cfs to 78 cfs with the most difficult passage conditions at the San Jon Road stream gage (HES 2015). Diversion of 2.99 cfs would curtail periods when migration for adult steelhead is possible. Assuming a minimum passage flow of 78 cfs at the San Jon Road stream gage site, it is estimated that there would be reductions of 0% to 20% (average 8%) in the number of days annually meeting the minimum migration threshold for adult steelhead (Figure 8, Table 5). The number of potential migration days is reduced in 9 years out of the 11 modeled and in 4 years the reduction is 10% or more. Although the actual number of days involved is generally small (1 to 2 fewer days meeting migration criteria), the migration windows (periods when flows are in a suitable range) are also relatively short. One or 2 days of additional flow could make the difference between successful passage through the lower watershed and failure. If migration periods are curtailed when the diversion causes flows to drop below passage thresholds, adult steelhead could become stranded below difficult passage locations such as the stream gage at San Jon Road. Given the species status as threatened, a change in flow of this magnitude (10% or more reduction in migration periods in 36% of years) is potentially significant for migrating adult steelhead.

Flow reductions in Tembladero Slough downstream of the Castroville proposed diversion would have less effect on steelhead migration than the diversion at Davis Road since Tembladero Slough has a very low gradient downstream of the Castroville proposed project site and there are no critical passage sections such as the riprap and gaging weir at San Jon Road upstream. Tembladero Slough is tidally influenced from the Old Salinas River up to Highway 183 in Castroville and the backwater condition caused by the tide gates would prevent measurable reductions in water levels throughout that reach (Schaaf & Wheeler 2014).

**Table 5: Simulated number of days meeting migration criteria (and percent reduction from base case) at San Jon Road during adult steelhead migration seasons. *Note*: migration season begins December 1 and ends April 30 the following year and is designated by the year it ends; partial periods (2002 and 2014) are omitted.**

| | Number of Days Meeting Adult Migration Criteria (78 cfs) | | | | |
|---|---|---|---|---|---|
| **Migration Period** | **Case 0** | **Case 1** | **Case 2** | **Case 3** | **Case 4** |
| 2003 | 8 | 7 (-13%) | 7 (-13%) | 7 (-13%) | 7 (-13%) |
| 2004 | 11 | 10 (-9%) | 10 (-9%) | 10 (-9%) | 10 (-9%) |
| 2005 | 31 | 29 (-6%) | 28 (-10%) | 29 (-6%) | 28 (-10%) |
| 2006 | 22 | 20 (-9%) | 18 (-18%) | 20 (-9%) | 18 (-18%) |
| 2007 | 1 | 1 (0%) | 1 (0%) | 1 (0%) | 1 (0%) |
| 2008 | 10 | 9 (-10%) | 9 (-10%) | 9 (-10%) | 9 (-10%) |
| 2009 | 8 | 8 (0%) | 7 (-13%) | 8 (0%) | 7 (-13%) |
| 2010 | 17 | 16 (-6%) | 16 (-6%) | 16 (-6%) | 16 (-6%) |
| 2011 | 22 | 21 (-5%) | 19 (-14%) | 21 (-5%) | 19 (-14%) |
| 2012 | 5 | 4 (-20%) | 4 (-20%) | 4 (-20%) | 4 (-20%) |
| 2013 | 9 | 8 (-11%) | 7 (-22%) | 8 (-11%) | 7 (-22%) |
| Total | 144 | 133 (-8%) | 126 (-13%) | 133 (-8%) | 126 (-13%) |

During the smolt migration period (March through May), flows at the Davis Road site are generally lower than during the adult migration period and proportional reduction in flow from the diversion would be greater (Figure 9). The 2.99 cfs Tembladero Slough diversion would similarly reduce flows downstream of the Castroville proposed diversion location (Figure 10). As described for adult migration, smolt migration flows are more an issue in the Reclamation Ditch, upstream of Tembladero Slough than in Tembladero Slough which is a low-gradient channel without critical passage sections and with tidal influence that tends to backwater the channel as far upstream as the Castroville Diversion location.

Although smolts need less flow to migrate in the Reclamation Ditch than adults, the channel is severely lacking in cover and smolts are exposed to potential predation from birds. Minimum migration flow for smolts is estimated at between 11 cfs and 31 cfs, depending on location, again with the most difficult passage at the San Jon Road stream gage (HES 2015). Proportional reductions in flow can be quite large in this range (Figure 9). For example, a flow of 3 cfs or more occurs at the Davis Road proposed project site approximately 56% of the time under the base case but only about 28% of the time with Case 1.

Based on a minimum passage flow for smolts of 31 cfs at the San Jon Road site, the number of days with flows meeting minimum smolt passage criteria is reduced by 0% to 7% annually or an average of 4% (Figure 11, Table 6). The reduction is never more than 10%. The number of days meeting smolt migration criteria is reduced under Case 1 compared to the base case (Case 0) in 2 years out of 11 years simulated. In some cases the actual reduction in terms of days is small however; the number of days available in the base case is also small at times (e.g. 2011). Flow alterations downstream of the Davis Road site of this magnitude do not meet the significance criteria during the smolt migration period and would be considered less than significant. It should be noted however, the accuracy of the flow threshold estimate for smolt migration is +/- 30%. If the lower end of the range were used for minimum passage flow for smolts (30% of 31 cfs is 22 cfs), the number of days meeting the passage criteria would be reduced by up to 17%, and 27% of years would have reductions of 10% or more.

**Table 6: Simulated number of days meeting migration criteria (and % reduction from base case) at San Jon Road during simulated steelhead smolt migration seasons (March-May).**

| | Number of Days Meeting Smolt Migration Criteria (31cfs) | | | | |
|---|---|---|---|---|---|
| **Migration Period** | **Case 0** | **Case 1** | **Case 2** | **Case 3** | **Case 4** |
| 2003 | 4 | 4 (0%) | 4 (0%) | 4 (0%) | 4 (0%) |
| 2004 | 2 | 2 (0%) | 2 (0%) | 2 (0%) | 2 (0%) |
| 2005 | 19 | 19 (0%) | 18 (-5%) | 19 (0%) | 18 (-5%) |
| 2006 | 41 | 38 (-7%) | 35 (-15%) | 38 (-7%) | 35 (-15%) |

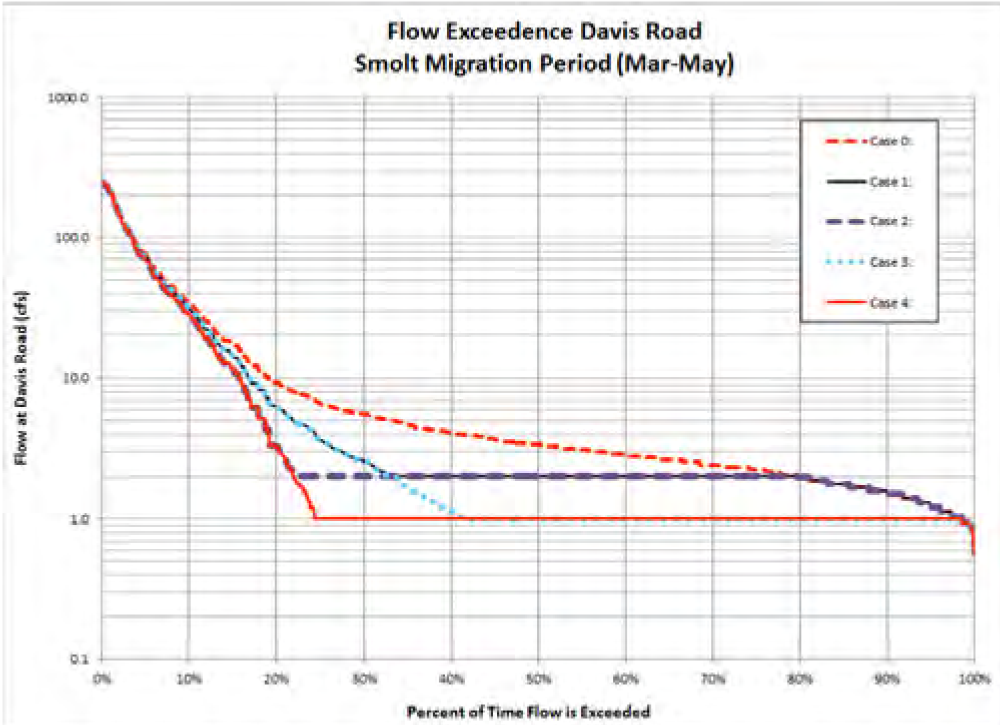

**Figure 9. Flow exceedance curve for Davis Road proposed project site during steelhead smolt migration period.**

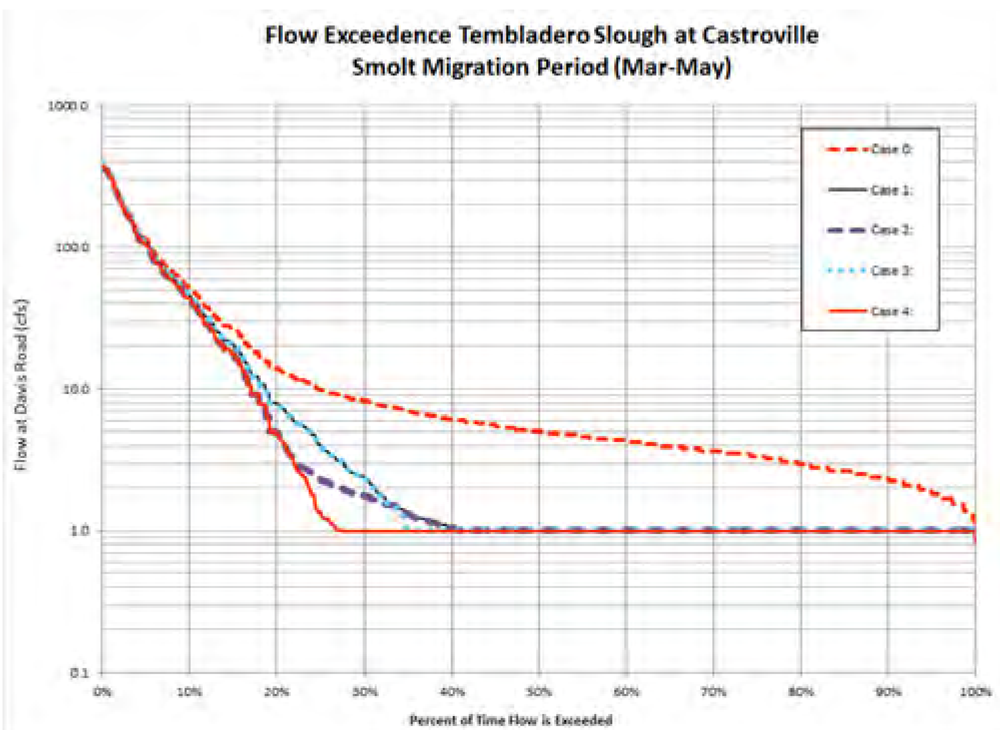

**Figure 10. Flow exceedance curve for Tembladero Slough at Castroville proposed project site during steelhead smolt migration period.**

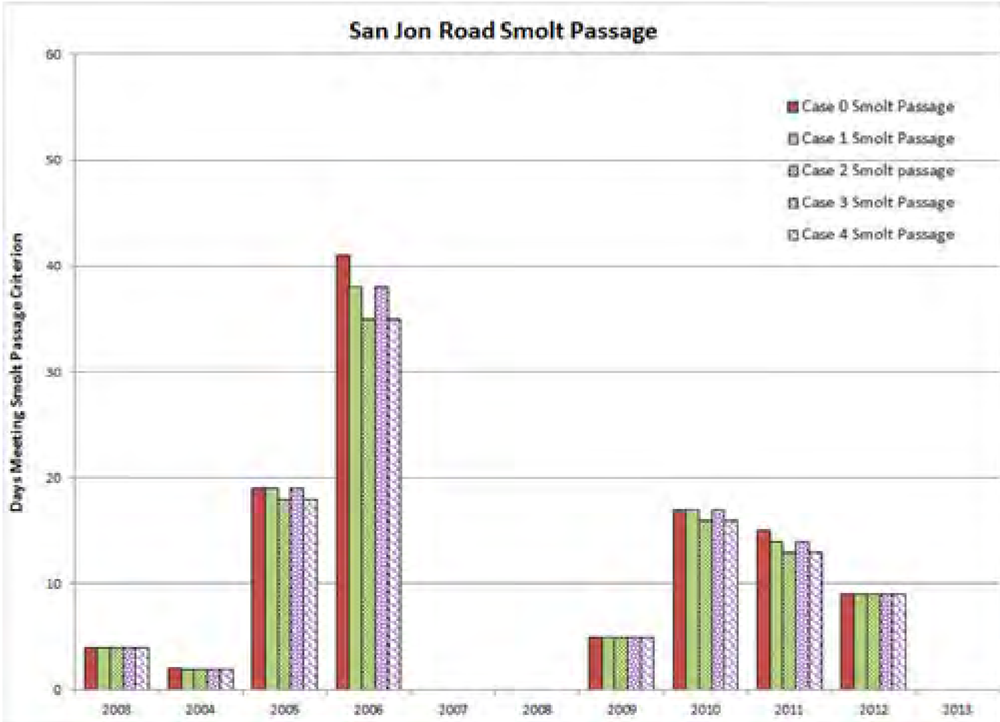

**Figure 11. Number of Days meeting minimum passage flow (31 cfs) for steelhead smolts downstream of the Davis Road proposed project site during March, April, and May.**

Flow reductions during the dry season exceed 10% across the majority of the range of flows simulated at Davis Road and Castroville (Figures 12 and 13). However, during the dry season (June-September), special status species are not expected to be present in the Reclamation Ditch downstream of the Davis Road proposed project site. Steelhead use these reaches only for migration, during the winter and spring, and potential dry season rearing habitat exists only in headwater reaches. There is a limited potential for tidewater goby near or downstream of the Castroville project site. Since goby prefer quiescent conditions, and since the channel is tidally backwatered in this reach, flow reductions in the range simulated would not be expected to have a detrimental effect on them, should they be present. Native and introduced warmwater species likely to be present are not migrating during this period. The 0.69 cfs minimum flow maintains base habitat conditions for species likely to be present. Flow changes from Case 1 during the dry season (Figures 12 and 13) would have a less than significant effect.

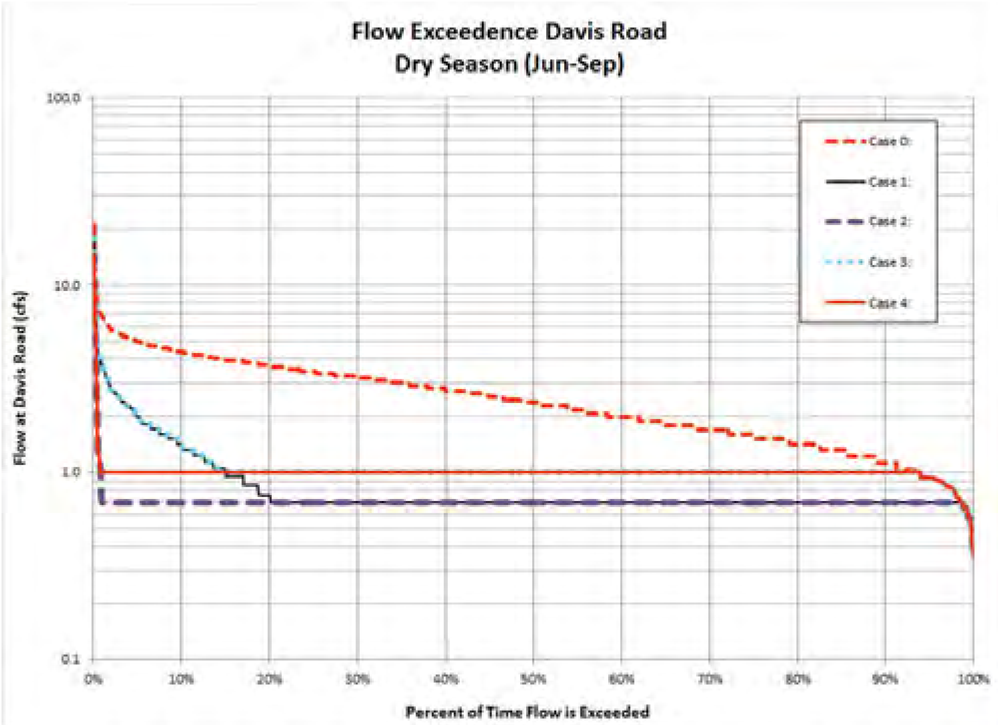

**Figure 12. Flow exceedance curve for Davis Road proposed project site during summer dry-season.**

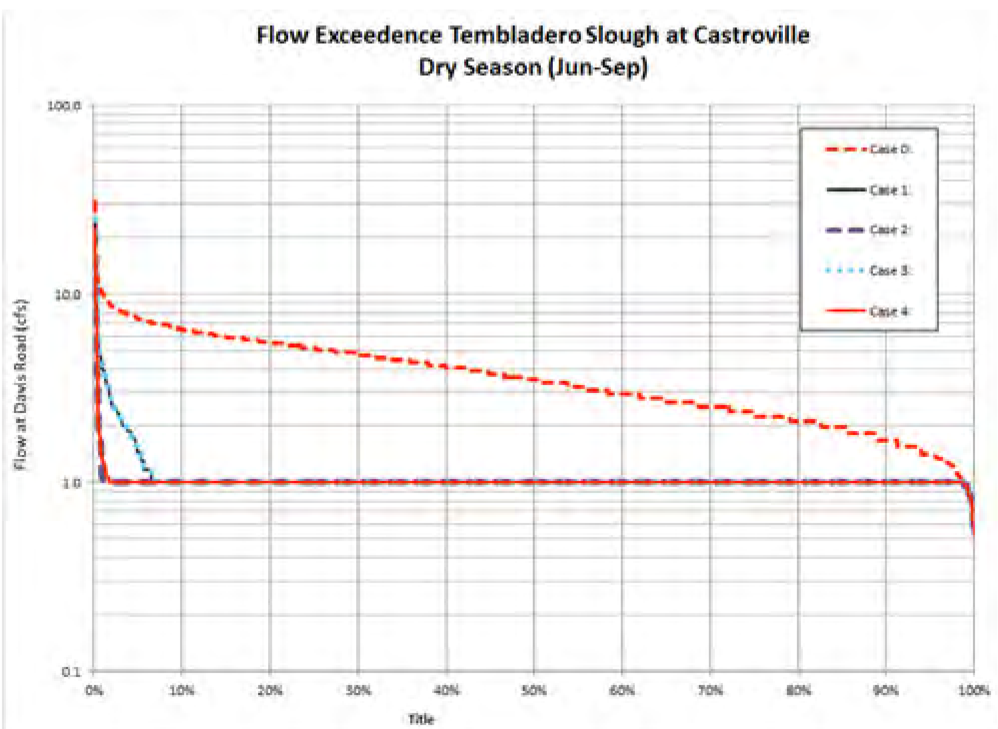

**Figure 13. Flow exceedance curve for Tembladero Slough at Castroville proposed project site during summer dry-season.**

#### *1.3.4.2 Case 2*

***Divert up to 6.0 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville with minimum bypass flow of 2 cfs December-May and 0.69 cfs June-November at Davis Road location and 1 cfs in Tembladero Slough.***

Analysis of Case 2 was identical to Case 1 except the Target Diversion at the Davis Road site was 6 cfs instead of 2.99 cfs. For Case 2 during the adult migration period, the largest proportional flow reductions in the Reclamation Ditch would occur in the range of 1 to 60 cfs. Flow reductions for base case flows of 60 cfs or less would be 10% or more for the Reclamation Ditch (Figure 6). The 2.99 cfs diversion at Castroville under Case 2, combined with the Davis Road diversion, results in larger flow reductions in Tembladero Slough and downstream reaches to Monterey Bay with flow reductions of 10% or more for Base Case flows of 1 to 90 cfs (Figure 7).

Case 2 has a greater potential effect on adult steelhead migration than Case 1 given the larger diversion rate. Assuming a minimum passage flow of 78 cfs at the San Jon Road stream gage site, it is estimated that there would be reductions of 0% to 22% (average 13%) in the number of days annually meeting the minimum migration threshold for adult steelhead (Figure 8, Table 5). The number of potential migration days is reduced in 10 years out of the 11 modeled and in 8 years the reduction is 10% or more. Although the actual number of days involved is generally small (1 to 4 fewer days meeting migration criteria), the migration windows (periods when flows are in a suitable range) are also relatively short. One or 2 days of additional flow could make the difference between successful passage through the lower watershed and failure. Curtailment of migration flows by this amount could limit the ability of steelhead to reach spawning habitat in the upper watershed and adult steelhead could become stranded below difficult passage locations such as the stream gage at San Jon Road. Given the species status as threatened, a change in flow of this magnitude (10% or more reduction in migration periods in 73% of years) is potentially significant for migrating adult steelhead.

As discussed previously for Case 1, flow reductions in Tembladero Slough downstream of the Castroville proposed diversion would have less effect on steelhead migration than the diversion at Davis Road since Tembladero Slough has a very low gradient downstream of the Castroville proposed project site and there are no critical passage sections such as the riprap and gaging weir at San Jon Road upstream. Tembladero Slough is tidally influenced from the Old Salinas River up to Highway 183 in Castroville and the backwater condition caused by the tide gates would prevent measurable reductions in water levels throughout that reach (Schaaf & Wheeler 2014).

During the smolt migration period (March through May), flows at the Davis Road site are generally lower than the adult migration period and proportional reduction in flow from the diversion would be greater (Figures 9 and 10). Although smolts need less flow to migrate than adults, the channel is severely lacking in cover and smolts are exposed to potential predation from birds. As previously described, smolt migration flows are more an issue in the Reclamation Ditch, upstream of Tembladero Slough than in Tembladero Slough which is a low-gradient channel without critical passage sections and with tidal influence that tends to backwater the channel as far upstream as the Castroville Diversion location.

Minimum migration flow for smolts is estimated at between 11 cfs and 31 cfs, depending on location, again with the most difficult passage at the San Jon Road stream gage (HES 2015). Based on a minimum passage flow for smolts of 31 cfs at the San Jon Road site, the number of days with flows meeting minimum smolt passage criteria is reduced by 0% to 15% annually or 9% on average (Figure 11, Table 6). The reduction is 10% or more in 2 of the 11 years simulated. The number of days meeting smolt migration criteria is reduced under Case 2 compared to the base case (Case 0) in 4 of 11 years simulated. In some cases the actual reduction in terms of days is small however; the number of days available in the base case is also small at times. Flow alterations of this magnitude during the smolt migration period, particularly given the sensitivity of smolts migrating through this degraded habitat, and considering the low accuracy of the method for estimating minimum passage flow, would be potentially significant downstream of the Davis Road site.

Flow reductions during the dry season (June-September) exceed 10% across the majority of the range of flows simulated at Davis Road and Castroville (Figures 12 and 13). Flow reductions from Case 2 result in the minimum bypass flow of 0.69 cfs at Davis Road and 1 cfs at Castroville occurring virtually the entire time (Figures 12 and 13). Special status species are not expected to be present in the Reclamation Ditch downstream of the Davis Road proposed project site during this period. Tidewater goby, if present in Tembladero Slough downstream of the Castroville site, are not likely to be affected by the flow changes projected. Native and introduced warmwater species likely to be present are not migrating during this period. The 0.69 cfs minimum flow maintains base habitat conditions for species likely to be present. Flow changes from Case 2 during the dry season would have a less than significant effect on fish species in the Reclamation Ditch and Tembladero Slough.

#### *1.3.4.3 Case 3*

> ***Divert up to 2.99 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville with 1 cfs bypass flow at both locations.***

Case 3 differs from Case 1 only in the amount of bypass flows provided: 1 cfs at both

Davis Road and Castroville in Case 3 vs. 2 cfs in winter and 0.69 cfs in summer below Davis Road for Case 1. For Case 3 during the adult migration period, the largest proportional flow reductions in the Reclamation Ditch at Davis Road would occur in the range of 1 to 30 cfs. Flow reductions in the Reclamation Ditch for base case flows in that range would be 10% or more (Figure 6). The 2.99 cfs diversion at Castroville under Case 3, combined with the Davis Road diversion, results in larger flow reductions in Tembladero Slough and downstream reaches to Monterey Bay with flow reductions of 10% or more for Base Case flows in the range of 1 to 60 cfs (Figure 7).

As discussed previously for Case 1, diversion at Castroville would have less effect on steelhead migration than diversion at Davis Road since Tembladero Slough has a very low gradient downstream of the Castroville proposed project site and there are no critical passage sections such as the riprap and gaging weir at San Jon Road upstream. Tembladero Slough is tidally influenced from the Old Salinas River up to Highway 183 in Castroville and the backwater condition caused by the tide gates would prevent measurable reductions in water levels throughout that reach (Schaaf & Wheeler 2014).

Assuming a minimum passage flow of 78 cfs at the San Jon Road stream gage site, it is estimated that there would be reductions of 0% to 20% (average 8%) in the number of days annually meeting the minimum migration threshold for adult steelhead (Figure 8, Table 5). This is identical to Case 1. The number of potential migration days is reduced in 9 years out of the 11 modeled and in 4 years the reduction is 10% or more. Although the actual number of days involved is generally small (1 to 2 fewer days meeting migration criteria), the migration windows (periods when flows are in a suitable range) are also relatively short. One or 2 days of additional flow could make the difference between successful passage through the lower watershed and failure. Curtailment of migration flows by this amount could limit the ability of steelhead to reach spawning habitat in the upper watershed and adult steelhead could become stranded below difficult passage locations such as the stream gage at San Jon Road. Given the species status as threatened, a change in flow of this magnitude (10% or more reduction in migration periods in 36% of years) is potentially significant for migrating adult steelhead.

During the smolt migration period (March through May), flows at the Davis Road site are generally lower than the adult migration period and proportional reduction in flow from the diversion would be greater (Figures 9 and 10). Although smolts need less flow to migrate than adults, the channel is severely lacking in cover and smolts are exposed to potential predation from birds. As previously described, smolt migration flows are more an issue in the Reclamation Ditch, upstream of Tembladero Slough than in Tembladero Slough which is a low-gradient channel without critical passage sections and with tidal influence that tends to backwater the channel as far upstream as the Castroville Diversion location.

Minimum migration flow for smolts is estimated at between 11 cfs and 31 cfs, depending on location, again with the most difficult passage at the San Jon Road stream gage (HES 2015). Based on a minimum passage flow for smolts of 31 cfs at the San Jon Road site, the number of days with flows meeting minimum smolt passage criteria is reduced by 0% to 7% annually or an average of 4% (Figure 11, Table 6), identical to Case 1. The reduction is never more than 10%. The number of days meeting smolt migration criteria is reduced under Case 3 compared to the base case (Case 0) in 2 years out of 11 years simulated. In some cases the actual reduction in terms of days is small however; the number of days available in the base case is also small at times (e.g. 2011). Flow alterations downstream of the Davis Road site of this magnitude do not meet the significance criteria during the smolt migration period and would be considered less than significant. As for Case 1, it should be noted that the accuracy of the flow threshold estimate for smolt migration is low and that if the lower end of the range were used for minimum passage flow for smolts the number of days meeting the passage criteria would be reduced by up to 17% from the Base Case, and 27% of years would have reductions of 10% or more.

Flow reductions during the dry season (June-September) exceed 10% across the majority of the range of flows simulated at Davis Road and Castroville (Figures 12 and 13). Flow reductions from Case 3 are comparable to Case 1 during the dry season except that Case 3 has the higher minimum bypass flow occurring in the Reclamation Ditch for about 80% of the time (Figures 12 and 13). Special status species are not expected to be present in the Reclamation Ditch downstream of the Davis Road proposed project site during the dry season. Tidewater goby, if present in Tembladero Slough downstream of the Castroville site, are not likely to be affected by the flow changes projected. Tidewater goby prefer quiescent conditions and the channel is tidally backwatered in this reach and should not experience significant drawdown related to project diversions. Native and introduced warmwater species likely to be present are not migrating during this period. The 1 cfs minimum flow maintains base habitat conditions for species likely to be present. Flow changes from Case 3 would have a less than significant effect on fish species in the Reclamation Ditch and Tembladero Slough during the dry season.

#### *1.3.4.4 Case 4*

> ***Divert up to 6.0 cfs of available flow from Reclamation Ditch at Davis Road and up to 2.99 cfs of available flow from Tembladero Slough at Castroville with 1 cfs bypass flow at both locations.***

Case 4 is identical to Case 2 except for the amount of bypass flows provided: 1 cfs at both Davis Road and Castroville in Case 4 vs. 2 cfs in winter and 0.69 cfs in summer below Davis Road for Case 2. During the adult migration period, the largest proportional flow reductions for Case 4 would occur in the range of 1 to 60 cfs for the reach downstream of Davis Road. Flow reductions for base case flows of 60 cfs or less would be 10% or more for the Reclamation Ditch (Figures 6). The 2.99 cfs diversion at Castroville under Case 4, combined with the Davis Road diversion, results in larger flow reductions in Tembladero Slough and downstream reaches to Monterey Bay with flow reductions of 10% or more for Base Case flows of 1 to 90 cfs (Figure 7).

Case 4 has a greater potential effect on adult steelhead migration than Case 1 or Case 3 given the larger diversion rate. Assuming a minimum passage flow of 78 cfs at the San Jon Road stream gage site, it is estimated that there would be reductions of 0% to 22% (average of 13%) in the number of days annually meeting the minimum migration threshold for adult steelhead (Figure 8, Table 5), identical to Case 2. The number of potential migration days is reduced in 10 years out of the 11 modeled and in 8 years the reduction is 10% or more. Although the actual number of days involved is generally small (1 to 4 fewer days meeting migration criteria), the migration windows (periods when flows are in a suitable range) are also relatively short. One or 2 days of additional flow could make the difference between successful passage through the lower watershed and failure. Curtailment of migration flows by this amount could limit the ability of steelhead to reach spawning habitat in the upper watershed and adult steelhead could become stranded below difficult passage locations such as the stream gage at San Jon Road. Given the species status as threatened, a change in flow of this magnitude (10% or more reduction in migration periods in 73% of years) is potentially significant for migrating adult steelhead.

As discussed previously for Case 1, flow reductions in Tembladero Slough downstream of the Castroville proposed diversion would have less effect on steelhead migration than the diversion at Davis Road since Tembladero Slough has a very low gradient downstream of the Castroville proposed project site and there are no critical passage sections such as the riprap and gaging weir at San Jon Road upstream. Tembladero Slough is tidally influenced from the Old Salinas River up to Highway 183 in Castroville and the backwater condition caused by the tide gates would prevent measurable reductions in water levels throughout that reach (Schaaf & Wheeler 2014).

During the smolt migration period (March through May), flows at the Davis Road site are generally lower than the adult migration period and proportional reduction in flow from the diversion would be greater (Figures 9 and 10). Although smolts need less flow to migrate than adults, the channel is severely lacking in cover and smolts are exposed to potential predation from birds. As previously described, smolt migration flows are more an issue in the Reclamation Ditch, upstream of Tembladero Slough than in Tembladero Slough which is a low-gradient channel without critical passage sections and with tidal influence that tends to backwater the channel as far upstream as the Castroville Diversion location.

Minimum migration flow for smolts is estimated at between 11 cfs and 31 cfs, depending on location, again with the most difficult passage at the San Jon Road stream gage (HES 2014). Based on a minimum passage flow for smolts of 31 cfs at the San Jon Road site, the number of days with flows meeting minimum smolt passage criteria is reduced by 0% to 15% annually or an average of 9% (Figure 11, Table 6), identical to Case 2. The reduction is 10% or more in 2 of the 11 years simulated. The number of days meeting smolt migration criteria is reduced under Case 4 compared to the base case (Case 0) in 4 of 11 years simulated. In some cases the actual reduction in terms of days is small however; the number of days available in the base case is also small at times. Flow alterations of this magnitude during the smolt migration period, particularly given the sensitivity of smolts migrating through this degraded habitat, and considering the low accuracy of the method for estimating minimum passage flow, would be potentially significant downstream of the Davis Road site.

Flow reductions during the dry season (June-September) exceed 10% across the majority of the range of flows simulated at Davis Road and Castroville (Figures 12 and 13). Flow reductions from Case 4 result in the minimum bypass flow of 1 cfs at both the Davis Road and Castroville locations occurring virtually the entire time (Figures 12 and 13). As in Cases 1, 2, and 3, flow reduction at the level that would occur for Case 4 would have less than significant effect on fish species potentially present in the Reclamation Ditch and Tembladero Slough during the dry season.

#### *1.3.4.5 Conclusion*

Case 1 and Case 3 have identical diversion profiles but differ in the minimum bypass amounts. Similarly, Case 2 and Case 4 have identical diversion profiles but feature higher diversions at Davis Road than Cases 1 and 3 (6 cfs vs. 2.99 cfs). All four cases have potentially significant effects on adult steelhead migration although Cases 2 and 4 have greater effect than Cases 1 and 3. The different minimum bypass provisions have no effect on steelhead migration since they are well below the minimum flows required for either smolts or adults. For adult migration it is estimated that there would be reductions of 0% to 20% (average 8%) in the number of days annually meeting the minimum migration threshold for both Case 1 and 3. For both Cases 2 and 4 average annual reduction in the number of days meeting the adult migration threshold would be 13%. During the hydrologic period examined, there would be a 10% or larger reduction in the number of days with flow meeting the migration threshold in 4 years out of 11 for Cases 1 and 3 and in 8 years out of 11 for Cases 2 and 4. Given steelheads status as a threatened species, a change in flow of this magnitude is potentially significant for migrating adult steelhead.

During the potential migration period for steelhead smolts, only Cases 2 and 4 would result in a significant reduction in the number of days meeting migration criteria, while

Cases 1 and 3 would have a less than significant effect. The number of days meeting migration criteria would be reduced in only two years under Cases 1 and 3 and the reduction would be less than 10% in both years. For Cases 2 and 4, the number of days meeting migration criteria would be reduced in 4 years out of 11 with 2 of those years having a reduction greater than 10%. Flow alterations of the magnitude occurring during the smolt migration period under Cases 2 and 4 would be potentially significant downstream of the Davis Road site, particularly given the sensitivity of smolts migrating through this degraded habitat, and considering the low accuracy of the method for estimating minimum passage flow.

Flow reductions during the dry season (June-September) exceed 10% across nearly the full range of baseline flows. However, special status species are not expected to be present in the Reclamation Ditch downstream of the Davis Road proposed project site. Steelhead use these reaches only for migration, during the winter and spring, and potential dry season rearing habitat exists only in headwater reaches. There is a limited potential for tidewater goby near or downstream of the Castroville project site. Since goby prefer quiescent conditions, and since the channel is tidally backwatered in this reach, flow reductions would not be expected to have a detrimental effect on them, should they be present. Native and introduced warmwater species likely to be present are not migrating during this period. Habitat in the Reclamation Ditch and Tembladero Slough are highly degraded in terms of channel structure, riparian vegetation, and water quality. The minimum bypass flows of 0.69 cfs (Cases 1 and 2) or 1 cfs (Cases 3 and 4) downstream of Davis Road maintain base habitat conditions for species likely to be present. Flow changes during the dry season for both cases would have a less than significant effect.

Overall, Cases 1 and 3 would have slightly less effect on steelhead migration than Cases 2 and 4 due to the lower diversion rates at Davis Road. Case 3 would have slightly more flow below Davis Road due to the higher bypass flow during the dry season but the effect is less than significant.

## 1.4 MITIGATION MEASURES

Potential significant effects on migrating adult steelhead and steelhead smolts could be mitigated by operating diversions to maintain flow within suitable windows for migration during periods when steelhead may be migrating. Steelhead adults migrate during December through April and require a flow of at least 78 cfs to pass over the weir at San Jon Road. If the diversion is operated to avoid dropping flow below this level, negative effects to migrating steelhead adults could be avoided. Steelhead smolts migrate primarily during March through May and require a flow of at least 31 cfs to meet passage criteria at the San Jon Road weir. Operating the diversion during March through May to avoid reducing flow below this level would avoid potentially significant effects on steelhead smolt migration.

When natural flow (without diversion) drops below these thresholds, presumably steelhead would no longer be able to migrate and diversions could be resumed. Since there is some uncertainty in the conditions required by steelhead to migrate and in estimating the flow level that meets those criteria, it is prudent do define a window for the migration flow threshold rather than to use a single numeric value. For example, it is assumed that adult steelhead need a depth of 0.7 feet to migrate but in fact they may be able to pass an obstacle with only 0.5 feet of depth. In addition, there is likely a minimum of at least 10% error in estimation of the flow that provides a depth of 0.7 feet. Given this potential for error it is not unreasonable to assume an error of +/- 30% in our estimate of the migration threshold (HES 2015). Therefore, a reasonable flow window for protection of adult steelhead migration would be 55 to 101 cfs. Similarly, a reasonable window for smolt migration would be 22 to 40 cfs. Operation of the diversion such that it would not cause flows to drop below the upper migration limit and would be resumed when flows drop below the lower migration threshold would avoid significant impacts to steelhead migration (Table 7).

**Table 7: Diversion schedule to avoid significant effects to migrating steelhead (flow measured at San Jon Road gage).**

| Migration Period | Operate Diversion only when flow is below (cfs): | Operate Diversion only when flow is above (cfs): |
|---|---|---|
| December | 55 | 101 |
| January | 55 | 101 |
| February | 55 | 101 |
| March | 22 | 101 |
| April | 22 | 101 |
| May | 22 | 40 |

Modification of the San Jon Road stream gage weir to allow passage of steelhead at lower flows could expand the range of flows when the diversion could be operated and would greatly increase the amount of time available for steelhead migration in the Reclamation Ditch watershed. For example, if the weir could be modified to allow passage at flows similar to the Boronda Road passage site then the migration threshold would be 32 cfs for adult steelhead and 11 for steelhead smolts. This would be approximately equivalent to flows of 34 cfs and 12 cfs at the San Jon Road gage[3]. The window for migration, calculated in the same way as for the San Jon Road site, would be 22 to 42 for adult steelhead and 8 to 14 for steelhead smolts. An operation schedule as in Table 8 would avoid significant effects on steelhead migration if the San Jon Road weir were modified to achieve passage at flows comparable to the Boronda Road site.

**Table 8: Diversion schedule to avoid significant effects to migrating steelhead if the San Jon Road weir were improved for steelhead passage (flow measured at San Jon Road gage).**

| Migration Period | Operate Diversion only when flow is below (cfs): | Operate Diversion only when flow is above (cfs): |
|---|---|---|
| December | 22 | 42 |
| January | 22 | 42 |
| February | 22 | 42 |
| March | 8 | 42 |
| April | 8 | 42 |
| May | 8 | 14 |

[3] Flow at Boronda Road is similar to the diversion site and is 93.7% of the flow at San Jon Road based on drainage area (Schaaf and Wheeler 2014)

**DATE:** February 27, 2015

**PROJECT:** Pure Water Monterey Groundwater Replenishment (GWR) Project – Estimation of Minimum Flows for Migration of Steelhead in the Reclamation Ditch

The Monterey Regional Water Pollution Control Agency (MRWPCA) is preparing an Environmental Impact Report (EIR) for the proposed Pure Water Monterey Groundwater Replenishment Project (GWR Project). The project will develop high quality replacement water for existing urban supplies; and an enhanced agricultural irrigation (Crop Irrigation) component that will increase the amount of recycled water available to the existing Castroville Seawater Intrusion Project in northern Monterey County. The project could involve diversion of flows from the Reclamation Ditch watershed at a site near Davis Road and a site in Castroville on Tembladero Slough (Figure 1). The reclamation ditch watershed has the potential to support steelhead trout (*Oncorhynchus mykiss*). Potential salmonid habitat exists upstream of the project site, although the extent and quality of such habitat has not been well quantified. Diversion of flow from the Reclamation Ditch has the potential to affect steelhead during periods when they are migrating, either upstream as adults or downstream as smolts.

Steelhead trout are listed as a threatened species under the Federal Endangered Species Act (ESA). Full levels of production for anadromous salmonids in Central California coastal streams rely on the ability of adult steelhead to enter the streams and easily access spawning and rearing habitat in the upper reaches and for smolts to return to the ocean. Unlike other Pacific salmon, some steelhead survive after spawning and return downstream to the ocean. As many as 20% of adult steelhead spawners may be repeat spawners and some fish may return to spawn up to 3 or 4 times (Shapovalov and Taft 1954). Even obstacles that are not complete barriers can impair populations by delaying migration rates and exposing fish to potential predation or poaching.

The purpose of the work described here was to identify fish passage obstacles between the Davis Road project site and the Tembladero Slough proposed diversion site and determine the minimum amount of flow necessary for steelhead migration through the reach. Passage in Tembladero Slough is not expected to be influenced by a diversion near Castroville since

Tembladero Slough is tidal up to this area and backwatering of the channel prevents formation of critical riffles or other shallow locations. The accepted methodology for minimum passage flow assessment involves measurement of stage and flow at a range of flows bracketing the minimum passage flow (CDFW 2013). The time frame for completion of the environmental documents did not provide opportunity to wait for winter flow conditions to collect the necessary data. Instead, HES used an alternative method using channel geometry measurements and the Manning equation to make an approximation of minimum passage flow needs. This method gives an "order-of-magnitude" approximation for planning level application only. This information was collected on October 20, 2014 during a site visit with representatives of HES, Monterey Peninsula Water Management District, Schaaf & Wheeler, and Denise Duffy & Associates.

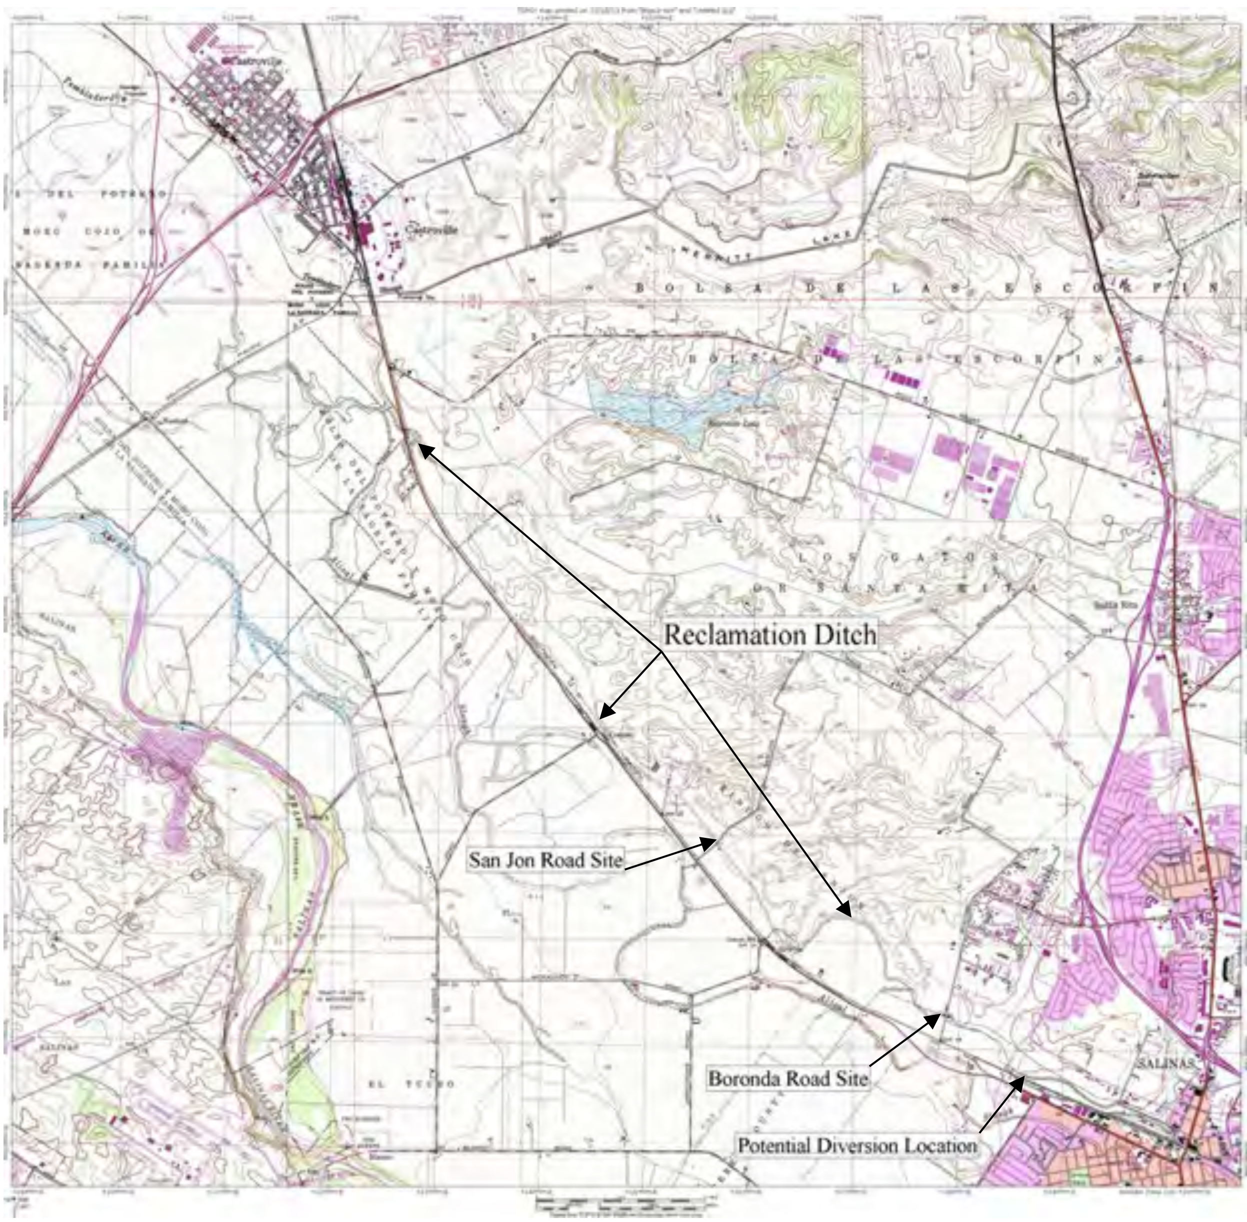

**Figure 1. Study area.**

During the October 20 site visit several road crossings of the Reclamation Ditch between Castroville and Salinas were evaluated for passage conditions.  Two sites, San Jon Road and Boronda Road (Figure 1), were selected for assessment based on judged severity of passage conditions and access issues.

The San Jon site has a USGS stream gage installation with a trapezoidal concrete channel section and gaging weir (Figure 2).  There are two elements that produce difficult passage at this site.  First is the concrete lip at the lower edge of the apron.  This presents a jumping obstacle at low flows without a pool at the base.  The second is the concrete apron itself which presents uniformly very shallow flow.  The concrete lip is probably not a problem for upstream migrating adults when there is sufficient flow for passage over the apron.  The lip is also not a problem for downstream migrating smolts or adults.  The Boronda Road site has rock rip-rap fill in the channel downstream of the road bridge creating a critical passage riffle (Figure 3).  This presents shallow water depth at lower flow levels without any other passage issues.

**Figure 2. San Jon Road critical passage site.**

Channel characteristics were measured at each of these sites for use in hydraulic modeling.  Data collection included a channel cross-section at each site detailing bed elevation and water surface; a longitudinal profile of the thalweg through the site detailing bed elevation and water surface; and an estimate for Manning resistance coefficient (n).  At the San Jon Road site, stage discharge data for the USGS gage were also available online (http://waterdata.usgs.gov/nwisweb/get_ratings?site_no=11152650&file_type=exsa).  This information was used to develop an approximation of minimum passage flow estimates for migrating adult steelhead and steelhead smolts.  Use of the Manning equation to estimate flow under these conditions is subject to substantial potential error. This information is used for project planning purposes only and is not a substitute for more rigorous methods such as the CDFW methodology (CDFW 2013). Passage flow estimates presented here should be verified by on-site observations during higher flow conditions.

**Figure 3. Boronda Road critical passage site.**

Methodology

The migration passage flow assessment is based on standards developed in the fisheries literature. These standards assume that there must be sufficient depth over the shallowest riffles for the target species to swim upstream with its body completely covered. Specifically, the critical depth must occur across 25% of the wetted channel width and across a contiguous section comprising 10% of the wetted channel width (Thompson 1972, Bjornn and Reiser 1991, CDFW 2013). The critical depths used in this analysis are 0.7 feet for adult steelhead and 0.4

feet for steelhead smolts. Although shallower critical depths are often justifiable (e.g. 0.6 feet for adults and 0.3 feet for smolts), these values were used in order to be consistent with the standards used by CDFW (CDFW 2013).

Flow velocity is also a consideration for migrating steelhead. Steelhead have strong swimming and leaping abilities that allow them to ascend streams into small tributary and headwater reaches. Steelhead can swim at rates of up to 4.5 feet per second (fps) for extended periods of time and can achieve burst speeds of 14 to 26 fps during passage through difficult areas (Bell 1986).

Critical passage flows are estimated through application of the Manning equation. The Manning equation is an empirical formula (based on observation rather than theory) that estimates the average velocity of a liquid flowing in an open channel (i.e., a conduit that does not completely enclose the liquid) (Gauckler 1867, Manning 1891).

The equation is given as:

$$V = k/n\ R_h^{\ 2/3}\ S^{\ 1/2}$$

where:

- $V$ is the cross-sectional average velocity ( ft/s in this application);
- $k$ is a conversion factor of 1.4859 $ft^{1/3}/s$;
- $n$ is the Manning coefficient (unitless);
- $R_h$ is the hydraulic radius (ft), also given by A/P where A is the cross-sectional area of flow ($ft^2$); and P is the wetted perimeter;
- $S$ is the slope of the hydraulic grade line or the linear hydraulic head loss (ft./ft.), which is the same as the channel bed slope when the water depth is constant.

Since flow (Q) is equal to VA the equation can be rewritten to solve for flow as:

$$Q = k/n\ A\ R_h^{\ 2/3}\ S^{\ 1/2}$$

This equation can be solved for any given flow stage with the channel geometry parameters: area, wetted perimeter, channel slope, and an estimate of the Manning coefficient.

At each passage study site, a critical cross-section was selected where the depth of flow was at a minimum across the channel width. Cross-sections incorporated the shallowest portion on the probable route a migrating salmonid would follow. A fiberglass survey tape was stretched across the channel and streambed and water surface elevations were measured at regular intervals along the tape using plane surveying techniques. A site benchmark was also established and surveyed. Conditions at each passage site were documented with photographs when measurements were made. Time was recorded at the beginning of each cross-section and at intervals across the channel. At the San Jon Road site, stage and time were recorded from the permanent staff plate at the station. Flow at the time of the survey was estimated from the 15-minute gage record at the San Jon Road site maintained by the USGS (http://waterdata.usgs.gov/usa/nwis/uv?site_no=11152650). Parameters used in the analysis and resulting flow and mean velocity estimates are presented in Table 1.

Cross-section data were entered in a spreadsheet configured to allow determination of the critical water surface elevation at which depth criteria were met. The cross-sectional area of flow is calculated from the channel bed elevation cross-section and measured or projected water surface elevation. Each point on the cross-section represents a cell with boundaries extending halfway to both adjacent measurement points and depth equal to the difference between the bed elevation and the water surface elevation. Cell width and depth are multiplied to give area and individual cell areas are summed across the cross-section. The wetted perimeter is the portion of the cross-section's perimeter that is "wet" and is also calculated by adding the length of bed for each cross-section cell. The channel slope was approximated from the USGS 1:24,000 topographical map for the area. Chow (1959) gives values for Manning coefficient based on channel condition. We used a value of 0.037 for both sites; this value is intermediate between an excavated or dredged channel, of earth, straight, uniform, with short grass and few weeds and an excavated or dredged channel, of earth, winding and sluggish, with stony bottom and weedy banks (Chow 1959).

For each depth criteria (0.4 or 0.7 feet) a stage was set for which 25% of the wetted channel width and a contiguous portion totaling at least 10% of the wetted width had a depth equal to or greater than the criteria value. Cross-section area and wetted perimeter were calculated and entered in the Manning equation to give an estimate of flow.

As a check on parameter value specification and overall performance of the analysis, the calculated flow values associated with target flow depths were compared to the rating curve for the San Jon Road stream gage site (Appendix A). The gage reads water levels a few feet upstream of the critical passage cross-section used in this analysis. On the October 20 survey date, the on-site staff plate read 0.72 at the time channel and water surface measurements were collected. This corresponds to a reported flow of 1.3 $ft^3/s$ (cfs) during that period. Use of the Manning equation resulted in a flow estimate of 2 cfs. The difference may be related to the very shallow flow across the apron at the time of the survey and the difficulty of getting accurate water surface elevations. An additional data point was available from observations made by Schaaf and Wheeler on February 9, 2015 (Andrew Sterbenz, personal communication, February 24, 2015). The depth of flow measured at 9:00 am on that date was 0.3 feet and the corresponding flow from the USGS gage was 18 cfs. Using a Manning coefficient value of 0.37 gives a flow estimate of 19 cfs. This description applies to the ditch in the near vicinity of the gage installation.

As can be seen, the San Jon Road site results in significantly higher minimum passage flow requirements than the less altered Boronda Road site (Table 1). The Boronda Road site is probably representative of other critical passage sections in the Reclamation Ditch downstream of the potential diversion location (e.g., the farm access road downstream of the San Jon Road site). Potential for steelhead migration success through the Reclamation Ditch could be dramatically improved by altering the San Jon Road site to a more passage friendly configuration.

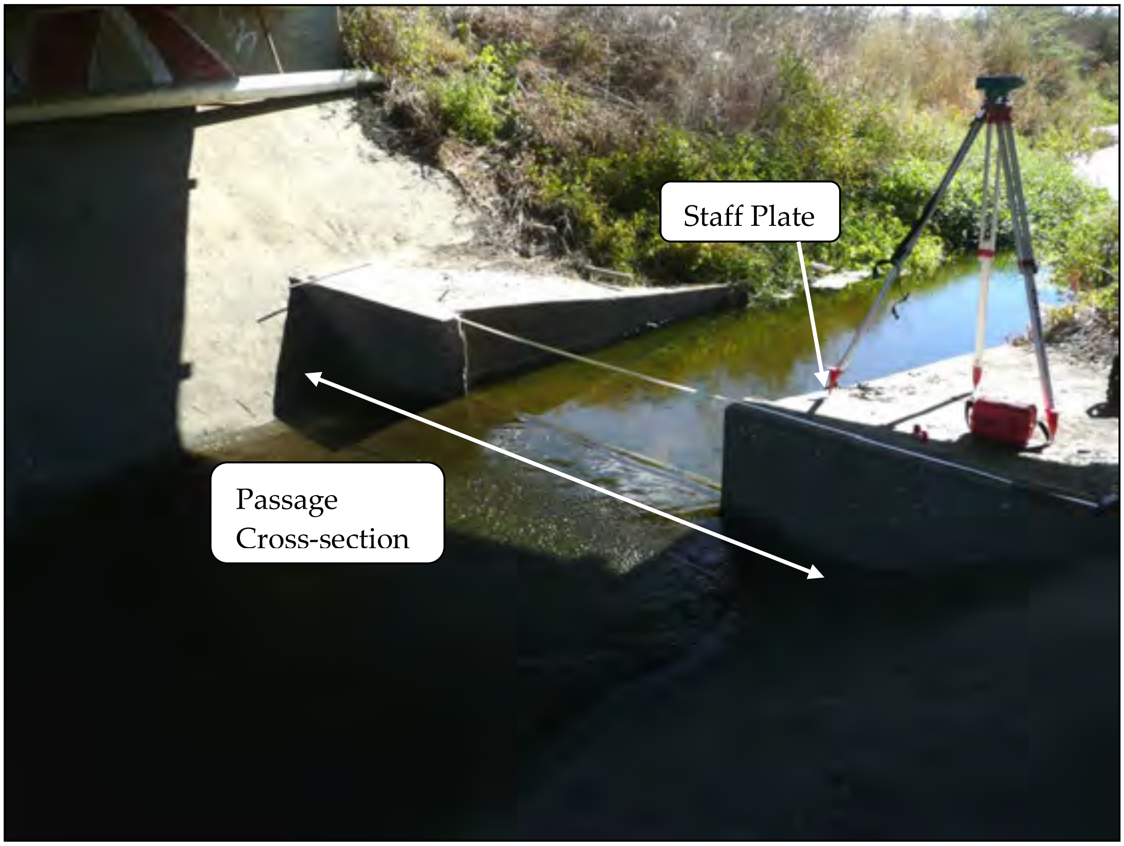

**Figure 4. San Jon Road site.**

This method gives an "order-of-magnitude" approximation of minimum flows for steelhead migration for planning level application only. There are numerous sources of error in the method including, estimation of parameter values, measurement of flow and associated rating curve, measurement of channel features and placement of cross-sections, and assumptions about depth required for steelhead passage. For example, it is assumed that adult steelhead need a depth of 0.7 feet to migrate but in fact they may be able to pass an obstacle with only 0.5 feet of depth. In addition, there is likely a minimum of at least 5-10% error in estimation of the flow that provides a depth of 0.7 feet. In addition, the Manning equation is an empirical equation for flow in uniform open channels. Uniform open channel flow takes place whenever there is a constant volumetric flow rate of liquid through a section of channel that has a constant bottom slope, constant hydraulic radius (that is constant channel size and shape), and constant channel surface roughness (constant Manning roughness coefficient). Under these conditions, the liquid will flow at a constant depth, often called the normal depth for the given channel and volumetric flow rate. Observations at the San Jon Road site indicate that the assumption of uniform flow may be problematic at some flows (Andrew Sterbenz, personal communication, February 2015). Given this potential for error it is not unreasonable to assume an error of +/-30% in our estimate of the migration threshold.

**Table 1: Channel geometry parameters for critical passage sites in the Reclamation Ditch with associated minimum passage flow estimates.**

| | San Jon Road | | | Boronda Road | | |
|---|---|---|---|---|---|---|
| **Parameter** | October 20 | Depth Criterion= 0.4 ft. | Depth Criterion= 0.7 ft. | October 20 | Depth Criterion= 0.4 ft. | Depth Criterion= 0.7 ft. |
| $n$ Manning coefficient | 0.037 | 0.037 | 0.037 | 0.037 | 0.037 | 0.037 |
| $S$ Hydraulic slope | 0.070 | 0.070 | 0.070 | 0.0280 | 0.0280 | 0.0280 |
| $A$ Cross-sectional area ($ft^2$) | 1.0949 | 5.5281 | 10.2636 | 1.3970 | 3.5157 | 6.8266 |
| $P$ Wetted perimeter (ft.) | 13.5651 | 14.8049 | 16.8706 | 9.0279 | 10.8492 | 11.8447 |

**Denise Duffy & Associates, Inc.**
PLANNING AND ENVIRONMENTAL CONSULTING

# MEMORANDUM

**Date:** March 19, 2015

**To:** Bob Holden, MRWPCA

**From:** Erin Harwayne, DD&A
Shaelyn Hession, DD&A

**Subject:** Pure Water Monterey Groundwater Replenishment Project – Revisions to the Reclamation Ditch at Davis Road Source Water Diversion Site and Blanco Drain Pipeline Source Water Diversion Site

---

The purpose of this memorandum is to identify any additional impacts to biological resources not previously considered, as a result of the revisions to the Project Study Area at the Reclamation Ditch at Davis Road Source Water Diversion Site (revised diversion site) and Blanco Drain Pipeline Source Water Diversion Site (revised pipeline site).

## Revised Reclamation Ditch at Davis Road Source Water Diversion Site

The proposed revised diversion site is located along the Reclamation Ditch, east of North Davis Road in Salinas, California, approximately 105 feet downstream of the location originally proposed (Figure 1). The revised diversion site includes approximately 0.06 acre of aquatic habitat and 0.11 acre ruderal/developed habitat initially evaluated as part of the Reclamation Ditch Affected Reach. An additional area of approximately 0.79 acre of ruderal/developed/agriculture habitat is now included as part of the revised site.

Given the proximity of the revised site to the location originally proposed, the habitat present within the revised site, and that a portion of the site had previous been evaluated and considered, no additional impacts to biological resources beyond impacts previously considered are expected as a result of the revision to the Project Study Area.

## Revised Blanco Drain Pipeline Source Water Diversion Site

The revision to the Project Study Area as part of the revised pipeline site includes the addition of approximately 5.8 acres to the Project Study Area, east of the Treatment Facilities at the Regional Treatment Plant (Figure 2). The revised pipeline site includes approximately 0.6 acre of non-native grassland, and 5.2 acres of ruderal/developed habitat. Most of the grassland included in the revised pipeline site is a continuation of grassland areas for which impacts were considered as part of the original Blanco Drain Diversion Site.

Given the proximity of the revised pipeline site to areas considered as part of the original Project Study Area, and the habitat present within the revised pipeline site, no additional impacts to biological resources beyond impacts previously considered are expected as a result of the revision.

If you have any questions or comments regarding this memorandum, please feel free to contact Erin Harwayne or Shaelyn Hession at (831) 373-4341.

**Record Count: 117**

# Appendix H

# Attachment 3 – List of Special-Status Plant and Wildlife Species Known or with the Potential to Occur in the Vicinity of the Project Study Area

*This Page Left Intentionally Blank*

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| **MAMMALS** | | | |
| *Antrozous pallidus* Pallid bat | --/ SSC/ -- | Occurs in a wide variety of habitats including grasslands, shrublands, arid desert areas, oak savanna, coastal forested areas, and coniferous forests of the mountain regions of California. Most common in open, dry habitats with rocky areas for roosting. Day roosts include caves, crevices, mines, and occasionally hollow trees and buildings. Seems to prefer rocky outcrops, cliffs, and crevices with access to open habitats for foraging. Similar structures are used for night roosting and will also use more open sites such as eaves, awnings, and open areas under bridges for feeding roosts. | **Moderate:** The pallid bat may roost in trees within the Project Study Area, most likely coast live oak trees and riparian forest, and may forage over non-native grasslands, central coastal scrub, and central maritime chaparral habitats. Therefore, it may occur at the Salinas Treatment Facility site, Blanco Drain site, Product Water Conveyance: RUWAP and Coastal alignment options, Injection Well Facilities site, CalAm Distribution System: Monterey Pipeline, and the three Affected Reaches. However, project components contain little to no habitat to support day roosts. |
| *Dipodomys venustus venustus* Santa Cruz kangaroo rat | --/ CNDDB/ -- | Common permanent residents of chaparral and foothill woodland habitats within the Santa Cruz Mountains from 0-1799 meters. Use well-drained loam or sandy loam soils for burrowing. Burrows are typically shallow (2-20 inches below the surface) and simple with a main chamber and few escape chambers. | **Unlikely:** Project Study Area is not located with the Santa Cruz Mountains. |
| *Lasiurus cinereus* Hoary bat | --/ CNDDB/ -- | Prefers open habitats or habitat mosaics with access to trees for cover and open areas or edge for feeding. Generally roost in dense foliage of trees. | **High:** The hoary bat may roost in within the Project Study Area, most likely coast live oak trees and riparian forest, and may forage over the open habitats, including non-native grasslands, central coastal scrub, and central maritime chaparral habitats. Therefore, it may occur at the Product Water Conveyance: RUWAP and Coastal alignment options, Injection Well Facilities site, and the three Affected Reaches.<br>There is a high potential for hoary bat to forage and roost within these habitats, but maternity roosts are unlikely to occur. |
| *Neotoma macrotis luciana* Monterey dusky-footed woodrat | --/ SSC/ -- | Forest and oak woodland habitats of moderate canopy with moderate to dense understory. Also occurs in chaparral habitats. | **High:** Suitable habitat is present within the oak woodland, coastal scrub, and maritime chaparral habitats within the Project Study Area. Woodrat nests were observed during surveys in 2014 within the Injection Well Facilities site. Suitable habitat occurs within the Salinas Treatment Facility site, Blanco Drain Diversion site, along the Product Water Conveyance: RUWAP and Coastal alignment options, Injection Well Facilities site, CalAm Distribution System: Monterey Pipeline, and the three Affected Reaches. The riparian habitat at Roberts Lake and Locke Paddon Lake is likely not dense enough to provide woodrat habitat and the species is unlikely to occur there. |
| *Reithrodontomys megalotis* | --/ CNDDB/ | Known only to occur from the Monterey Bay region. Occurs in fresh and brackish water wetlands, and probably in the | **Moderate:** Three CNDDB occurrences of this species are recorded within the Project Study Area, near Seaside Marina, and |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *distichlis* Salinas harvest mouse | -- | adjacent uplands around the mouth of the Salinas River. | Armstrong Ranch. Suitable habitat present at the SalinasTreatment Facility site, Blanco Drain Diversion site, Lake El Estero, Locke Paddon Lake (Product Water Conveyance: Coastal alignment option) (included in CNDDB occurrence), Roberts Lake (adjacent to CNDDB occurrence) (CalAm Distribution System: Monterey Pipeline) & the Affected Reaches. |
| *Sorex ornatus salarius* Monterey ornate shrew | --/ SSC/ -- | Mostly moist or riparian woodland habitats, and within chaparral, grassland, and emergent wetland habitats where there is a thick duff or downed logs. | **Moderate:** Suitable habitat is present within the Project Study Area along the Salinas River within the Salinas Treatment Facility and the Blanco Drain Diversion sites, Product Water Conveyance: RUWAP and Coastal alignment options, Injection Well Facilities site, CalAm Distribution System: Monterey Pipeline, and the three Affected Reaches. The CNDDB does not report any occurrences within the 16 Quads analyzed; however, this species is known to occur within the vicinity of the Project Study Area (Bolster, 1998). |
| *Taxidea taxus* American badger | --/ SSC/ -- | Dry, open grasslands, fields, pastures savannas, and mountain meadows near timberline are preferred. The principal requirements seem to be sufficient food, friable soils, and relatively open, uncultivated grounds. | **High:** One CNDDB occurrence of this species is recorded within the Project Study Area, near Seaside and Sand City. However, this is a historic occurrence and the area has since been developed. Suitable habitat within the Project Study Area is present within the non-native grassland habitat within the Product Water Conveyance: RUWAP and Coastal alignment options. |
| **BIRDS** | | | |
| *Accipiter cooperii* Cooper's hawk | --/ WL/ -- | Resident throughout most of the wooded portion of the state. Dense stands of live oak, riparian deciduous, or other forest habitats near water used most frequently. Seldom found in areas without dense tree stands, or patchy woodland habitats. | **Moderate:** Possible nesting and foraging habitat is present within the Project Study Area. |
| *Agelaius tricolor* Tricolored blackbird | --/ SSC/ -- | Nest in colonies in dense riparian vegetation, along rivers, lagoons, lakes, and ponds. Forages over grassland or aquatic habitats. | **High:** The CNDDB reports an occurrence of this species at Locke Paddon Lake. |
| *Aquila chrysaetos* Golden eagle | --/ FP/ -- | Use rolling foot-hills, mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, cliffs, and rocky outcrops. Nest in secluded cliffs with overhanging ledges as well as large trees. | **Low:** Foraging habitat is present within the Project Study Area |
| *Asio flammeus* Short-eared owl | --/ SSC/ -- | Usually found in open areas with few trees, such as annual and perennial grasslands, prairies, meadows, dunes, irrigated lands, and saline and freshwater emergent marshes. Dense vegetation is required for roosting and nesting cover. This includes tall grasses, brush, ditches, and wetlands. Open, | **Unlikely:** This species does not breed within Monterey County and only low quality overwintering habitat is present within the Project Study Area. The Project is unlikely to impact this species, as overwintering habitat is not typically protected. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| | | treeless areas containing elevated sites for perching, such as fence posts or small mounds, are also needed. Some individuals breed in northern California. | |
| *Athene cunicularia* Burrowing owl | --/ SSC/ -- | Year round resident of open, dry grassland and desert habitats, and in grass, forb and open shrub stages of pinyon-juniper and ponderosa pine habitats. Frequent open grasslands and shrublands with perches and burrows. Use rodent burrows (often California ground squirrel) for roosting and nesting cover. Pipes, culverts, and nest boxes may be substituted for burrows in areas where burrows are not available. | **High:** Three CNDDB occurrences of this species are recorded within the Project Study Area. Suitable habitat for this species is present within the non-native grassland habitat along the Product Water Conveyance: RUWAP and Coastal alignment options. Additionally, this species may be present within the coastal dune scrub areas within the CalAm Distribution System: Monterey Pipeline, based on CNDDB observations within the area and despite the lack of typical habitat for the species. |
| *Brachyramphus marmoratus* Marbled murrelet (nesting) | FT/ SE/ -- | Occur year-round in marine subtidal and pelagic habitats from the Oregon border to Point Sal. Partial to coastlines with stands of mature redwood and Douglas-fir. Requires dense mature forests of redwood and/or Douglas-fir for breeding and nesting. | **Unlikely:** No CNDDB occurrences within quads searched. No habitat is present within the Project study area. |
| *Buteo regalis* Ferruginous hawk | --/ CNDDB/ -- | An uncommon winter resident and migrant at lower elevations and open grasslands in the Modoc Plateau, Central Valley, and Coast Ranges and a fairly common winter resident of grassland and agricultural areas in southwestern California. Frequent open grasslands, sagebrush flats, desert scrub, low foothills surrounding valleys, and fringes of pinyon-juniper habitats. Does not breed in California. | **Low:** A CNDDB occurrence of this species is recorded within the Project Study Area near Armstrong Ranch. However, this species does not breed in California and is, therefore, unlikely to be impacted by the Project. |
| *Charadrius alexandrius nivosus* Western snowy plover | FT/ SSC/ -- | Sandy beaches on marine and estuarine shores, also salt pond levees and the shores of large alkali lakes. Requires sandy, gravelly or friable soil substrate for nesting. | **Unlikely:** Three CNDDB occurrences are recorded within portions of the Project Study Area. No suitable habitat for this species is present within the Project Study Area. However, suitable habitat is present immediately adjacent to the Project Study Area at the southern end of Fort Ord, near the Highway One Fremont Street Exit in Seaside (Seaside occurrence). |
| *Cypseloides niger* Black swift | --/ SSC/ -- | Regularly nests in moist crevices or caves on sea cliffs above the surf, or on cliffs behind or adjacent to waterfalls in deep canyons. Forages widely over many habitats. | **Unlikely:** No suitable habitat present within the Project Study Area. The nearest CNDDB occurrence is approximately five miles from the Project Study Area. |
| *Elanus leucurus* White-tailed kite | --/ FP/ -- | Open groves, river valleys, marshes, and grasslands. Prefer such area with low roosts (fences etc.). Nest in shrubs and trees adjacent to grasslands. | **High:** Appropriate nesting and foraging habitat present within the Project Study Area, particularly within the vicinity of Armstrong Ranch. The nearest CNDDB occurrence is approximately seven miles from the Project Study Area; however, an occurrence is also known within Armstrong Ranch, immediately adjacent to the Project Study Area. |
| *Empidonax* | FE/ | Breeds in riparian habitat in areas ranging in elevation from | **Unlikely:** No CNDDB occurrences within quads searched. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *traillii extimus* Southwestern willow flycatcher (nesting) | SE/ -- | sea level to over 2,600 meters. Builds nest in trees in densely vegetated areas. This species establishes nesting territories and builds, and forages in mosaics of relatively dense and expansive areas of trees and shrubs, near or adjacent to surface water or underlain by saturated soils. Not typically found nesting in areas without willows (*Salix sp*.), tamarisk (*Tamarix ramosissima)*, or both. | Habitat is present within the Project Study Area. This species has a low potential for occurrence as no breeding pairs have been seen in recent decades and the species is unlikely to reoccupy this area until brown-headed cowbirds, which parasitize the nest of other species, are heavily controlled. |
| *Eremophila alpestris actia* California horned lark | --/ WL/ -- | Variety of open habitats, usually where large trees and/or shrubs are absent. Found from grasslands along the coast to deserts at sea-level and alpine dwarf-shrub habitats are higher elevations. Builds open cup-like nests on the ground. | **High:** A CNDDB occurrence of this species is recorded within the Project Study Area near Armstrong Ranch in Marina. Suitable habitat is present within the Project Study Area within the non-native grassland habitat at the Product Water Conveyance: RUWAP and Coastal alignment options. |
| *Falco mexicanus* Prairie falcon | --/ WL/ -- | Associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields, and desert scrub areas. Uses open terrain for foraging; nests in open terrain with canyons, cliffs, escarpments, and rock outcrops. | **Low:** May forage within Project Study Area, near Armstrong Ranch. No suitable nesting habitat is present within the Project Study Area and is, therefore, unlikely to be impacted by the Project. The nearest CNDDB occurrence is within the Spreckels Quad (exact occurrence location information not available). |
| *Oceanodroma homochroa* Ashy storm petrel | --/ SSC/ -- | Tied to land only to nest, otherwise remains over open sea. Nests in natural cavities, sea caves, or rock crevices on offshore islands and prominent peninsulas of the mainland. | **Unlikely:** No suitable habitat present within the Project Study Area. |
| *Pelecanus occidentalis californicus* California brown pelican | FD/ SD,FP/ -- | Found in estuarine, marine subtidal, and marine pelagic waters along the California coast. Usually rests on water or inaccessible rocks, but also uses mudflats, sandy beaches, wharfs, and jetties. | **Unlikely:** Only low quality habitat is present within the Project Study Area. |
| *Rallus longirostris obsoletus* California clapper rail | FE/ SE,FP/ -- | Occur within a range of salt and brackish marshes. | **Unlikely:** Only low quality habitat is present within the Project Study Area. This species is now likely restricted to the San Francisco Bay area. Occurrences have been recorded at Elkhorn Slough; however, this species has not been observed there since the 1980s. |
| *Riparia riparia* Bank swallow | --/ ST/ -- | Nest colonially in sand banks. Found near water; fields, marshes, streams, and lakes. | **Unlikely:** No suitable habitat present within the Project Study Area. The nearest CNDDB occurrence is approximately 3 miles from the Project Study Area. An occurrence of this species was also reported by California State Parks in 2008 on Fort Ord, approximately 2,000 feet from the Product Water Conveyance: Coastal alignment option. |
| *Sterna antillarum* | FE / SE,CFP/ | Sea beaches, bays; large rivers, bars. | **Unlikely:** No CNDDB occurrences within quads searched. No habitat is present within the Project Study Area. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *browni*<br>California least tern (nesting colony) | -- | | |
| *Vireo bellii pusillus*<br>Least Bell's vireo | FE/<br>SE/<br>-- | Riparian habitats. Breed in willow riparian forest supporting a dense, shrubby understory. Oak woodland with a willow riparian understory is also used in some areas, and individuals sometimes enter adjacent chaparral, coastal sage scrub, or desert scrub habitats to forage. | **Unlikely:** Only low quality habitat is present within the Project Study Area; considered extirpated in northern Monterey County. |
| **REPTILES AND AMPHIBIANS** | | | |
| *Ambystoma californiense*<br>California tiger salamander | FT/<br>ST/<br>-- | Annual grassland and grassy understory of valley-foothill hardwood habitats in central and northern California. Need underground refuges and vernal pools or other seasonal water sources. | **Unlikely:** No breeding habitat is present within the Project Study Area. Several breeding locations are known within Fort Ord; however, all of these are located 2.0 miles or greater from the Project Study Area, outside of the known dispersal range for this species. A tiger salamander breeding site is also known within Armstrong Ranch, approximately 300 feet from the Project Study Area, and suitable upland habitat is present within the Project Study Area in this area. However, it was determined through genetic testing that the tiger salamander population at this location was non-native. |
| *Ambystoma macrodactylum croceum*<br>Santa Cruz long-toed salamander | FE/<br>SE/<br>-- | Preferred habitats include ponderosa pine, montane hardwood-conifer, mixed conifer, montane riparian, red fir, and wet meadows. This is an isolated subspecies which occurs in a small number of localities in Santa Cruz and Monterey Counties. Adults spend the majority of the time in underground burrows and beneath objects. Larvae prefer shallow water with clumps of vegetation. | **Unlikely:** No breeding habitat is present on the Project Study Area. The nearest CNDDB occurrence is approximately five miles Project Study Area, outside of the potential dispersal range for this species. |
| *Anniella pulchra*<br>California legless lizard (includes *A. p. nigra* and *A. p. pulchra* as recognized by the DFG) | --/<br>SSC/<br>-- | Requires moist, warm habitats with loose soil for burrowing and prostrate plant cover, often forages in leaf litter at plant bases; may be found on beaches, sandy washes, and in woodland, chaparral, and riparian areas. | **High:** Suitable habitat present within any of the undeveloped areas of the Project Study Area. The CNDDB reports occurrences within six of the 16 Quads analyzed. Additionally, a specific occurrence is reported within the Project Study Area in Marina, near the Fort Ord Natural Reserve (FONR). |
| *Emys marmorata*<br>Western pond turtle | --/<br>SSC/<br>-- | Associated with permanent or nearly permanent water in a wide variety of habitats including streams, lakes, ponds, irrigation ditches, etc. Require basking sites such as partially submerged logs, rocks, mats of vegetation, or open banks. | **High:** Suitable habitat is present within the Project Study Area near Locke Paddon Lake and Robert's Lake. The nearest CNDDB occurrence is less than 100 feet from the Project Study Area. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| | | | |
| *Phrynosoma blainvillii* Coast horned lizard | --/ SSC/ -- | Associated with open patches of sandy soils in washes, chaparral, scrub, and grasslands. | **High:** Two CNDDB occurrences of this species are recorded within the Project Study Area near Armstrong Ranch. Suitable habitat for this species is present within the Project Study Area of the Product Water Conveyance: RUWAP and Coastal alignment options, Injection Well Facilities site, CalAm Distribution System: Monterey Pipeline, Reclamation Ditch Affected Reach, and Old Salinas River Channel Affected Reach. |
| *Rana boylii* Foothill yellow-legged frog | --/ SSC/ -- | Partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats, including hardwood, pine, and riparian forests, scrub, chaparral, and wet meadows. Rarely encountered far from permanent water. | **Unlikely:** No habitat is present within the Project Study Area. |
| *Rana draytonii* California red-legged frog | FT/ SSC/ -- | Lowlands and foothills in or near permanent or late-season sources of deep water with dense, shrubby, or emergent riparian vegetation. During late summer or fall adults are known to utilize a variety of upland habitats with leaf litter or mammal burrows. | **High:** The nearest CNDDB occurrence is located approximately one mile from the Project Study Area along the Salinas River. CRLF were observed breeding at this location in 2009. Appropriate breeding habitat also includes Roberts Lake and Locke Paddon Lake; although these resources are likely outside of the dispersal range for CRLF. |
| *Taricha torosa* Coast Range newt | --/ SSC/ -- | Occurs mainly in valley-foothill hardwood, valley-foothill hardwood-conifer, coastal scrub, and mixed chaparral but is known to occur in grasslands and mixed conifer types. Seek cover under rocks and logs, in mammal burrows, rock fissures, or man-made structures such as wells. Breed in intermittent ponds, streams, lakes, and reservoir. | **Moderate:** Aestivation habitat is present within the Project Study Area. |
| *Thamnophis hammondii* Two-striped garter snake | --/ SSC/ -- | Associated with permanent or semi-permanent bodies of water bordered by dense vegetation in a variety of habitats from sea level to 2400m elevation. | **Moderate:** Suitable habitat is present within the Project Study Area near Locke Paddon Lake and Roberts Lake. The nearest CNDDB occurrence is approximately 10 miles from the Project Study Area. |
| **INVERTEBRATES** | | | |
| *Branchinecta lynchi* Vernal pool fairy shrimp | FT/ --/ -- | Require ephemeral pools with no flow. Associated with vernal pool/grasslands from near Red Bluff (Shasta County), through the central valley, and into the South Coast Mountains Region. Require ephemeral pools with no flow. | **Unlikely:** No CNDDB occurrences within quads searched. California fairy shrimp (*Linderella occidentalis*) known to occur in vernal pools in the vicinity of the Project Study Area, but no vernal pool fairy shrimp have been identified. No habitat is present within the Project Study Area. |
| *Cicindela ohlone* Ohlone tiger beetle | FE/ CNDDB/ -- | Coastal terraces with remnant stands of open native grassland with clay or sandy soils. Hunt, breed, and dig small vertical burrows along sunny single-track trails and dirt roads (maintained by cattle, hikers, etc.) in coast terrace meadows that still support native grasses. Current range from the City of | **Unlikely:** Project Study Area is outside of the known current range. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| | | Scotts Valley to the eastern edge of the City of Santa Cruz. | |
| *Coelus globosus* Globose dune beetle | --/ CNDDB/ -- | Coastal dunes. These beetles are primarily subterranean, tunneling through sand underneath dune vegetation. | **Unlikely:** Suitable habitat is present within the foredune habitat adjacent to the Project Study Area. The nearest CNDDB occurrence is approximately 1,000 feet from the Project Study Area, near the Highway 1 Fremont Street Exit in Seaside. This species is restricted to the foredunes within 100 feet of the wave wash zone. It has not been collected from Monterey beaches for many years, and may have been extirpated in the Project vicinity (Doyen, 1976). |
| *Danaus plexippus* Monarch butterfly | --/ CNDDB/ -- | Overwinters in coastal California using colonial roosts generally found in Eucalyptus, pine, and acacia trees. Overwintering habitat for this species within the Coastal Zone represents ESHA. Local ordinances often protect this species as well. | **High:** A CNDDB occurrence of this species is reported within the Project Study Area, located within the Eucalyptus grove across from the Naval Post-graduate School in Monterey along the CalAm Distribution System: Monterey Pipeline. |
| *Euphilotes enoptes smithi* Smith's blue butterfly | FE/ CNDDB/ -- | Most commonly associated with coastal dunes and coastal sage scrub plant communities in Monterey and Santa Cruz Counties. Plant hosts are *Eriogonum latifolium* and *E. parvifolium*. | **High:** The CNDDB reports an occurrence of this species that ranges from Seaside to Monterey and includes portions of the Project Study Area. The host plants for this species were identified within the Project Study Area, near Fort Ord Dunes State Park (Product Water Conveyance: Coastal alignment option) and Window on the Bay Waterfront Park (CalAm Distribution System: Monterey Pipeline). In addition, the coastal scrub and coastal dune scrub habitats within the Reclamation Ditch Affected Reach and Old Salinas Channel Affected Reach may support obligate host species. |
| *Helminthoglypta sequoicola consors* Redwood shoulderband snail | --/ CNDDB/ -- | Known only from the south slope of San Juan grade, near foot, 8 miles northwest of Salinas. | **Unlikely:** The only known occurrence of this species is not in the vicinity of the Project Study Area. |
| *Linderiella occidentalis* California linderiella | --/ CNDDB/ -- | Ephemeral ponds with no flow. Generally associated with hardpans. | **Unlikely:** No suitable habitat present within the Project Study Area. |
| *Optioservus canus* Pinnacles optioservus riffle beetle | --/ CNDDB/ -- | Species of this genus generally prefer gravelly or rocky streams and some often occur on moss covered rocks. Both adults and larvae crawl on rocks and gravel mostly in riffle areas. | **Unlikely:** No suitable habitat present within the Project Study Area. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *Trimerotropis infantilis* Zayante band-winged grasshopper | FE/ CNDDB/ -- | Open sandy areas with sparse, low annual and perennial herbs on high ridges with sparse ponderosa pine. Often occurs with Ben Lomond wallflower. Restricted to sand parkland habitat found on ridges and hills within the Zayante sandhills habitat in Santa Cruz County. Flight season extends from late May through August. | **Unlikely:** No suitable habitat present within the Project Study Area. |
| *Tryonia imitator* Mimic tryonia (=California brackishwater snail) | --/ CNDDB/ -- | Inhabits coastal lagoons, estuaries and salt marshes. Found only in permanently submerged areas in a variety of sediment types. Tolerant of a wide range of salinities. | **Low:** Marginal habitat is present within Roberts Lake and the Old Salinas River Channel. There are no occurrences known for Roberts Lake and the habitat present is marginal. A historic CNDDB occurrence is present within the Affected Reaches Project Study Area in the Old Salinas River Channel; however, this occurrence is from 1981 and presence at this location is listed as extirpated. The nearest modern CNDDB occurrence is approximately 0.5 miles from the Project Study Area within Elkhorn Slough. |
| **PLANTS** | | | |
| *Agrostis lacuna-vernalis* Vernal pool bent grass | --/ CNDDB / 1B | Vernal pool mima mounds at elevations of 115-145 meters. Annual herb in the Poaceae family; blooms April-May. Known only from Butterfly Valley and Machine Gun Flats of Ft. Ord National Monument. | **Unlikely:** No suitable habitat present within the Project Study Area and not identified during focused botanical surveys in 2014. |
| *Allium hickmanii* Hickman's onion | --/ CNDDB/ 1B | Closed-cone coniferous forests, maritime chaparral, coastal prairie, coastal scrub, and valley and foothill grasslands at elevations of 5-200 meters. Bulbiferous herb in the Alliaceae family; blooms March-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Artcostaphylos andersonii* Anderson's manzanita | --/ CNDDB / 1B | Openings and edges of broadleaved upland forest, chaparral, and north coast coniferous forest at elevations of 60-760 meters. Evergreen shrub in the Ericaceae family; blooms November-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Artcostaphylos edmundsii* Little Sur manzanita | --/ CNDDB/ 1B | Coastal bluff scrub and chaparral on sandy soils at elevations of 30-105 meters. Evergreen shrub in the Ericaceae family; blooms November-April. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Arctostaphylos hookeri* ssp. *hookeri* Hooker's manzanita | --/ CNDDB / 1B | Closed-cone coniferous forest, chaparral, cismontane woodland, and coastal scrub on sandy soils at elevations of 85-536 meters. Evergreen shrub in the Ericaceae family; blooms January-June. | **Present:** Observed near CSUMB and the Naval Post-Graduate School in the City of Monterey during focused botanical surveys in 2009, 2010, and 2014. |
| *Arctostaphylos montereyensis* | --/ CNDDB | Maritime chaparral, cismontane woodland, and coastal scrub on sandy soils at elevations of 30-730 meters. Evergreen | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| Toro manzanita | 1B | shrub in the Ericaceae family; blooms February-March. | |
| *Arctostaphylos pajaroensis* Pajaro manzanita | --/ CNDDB 1B | Chaparral on sandy soils at elevations of 30-760 meters. Evergreen shrub in the Ericaceae family; blooms December-March. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Arctostaphylos pumila* Sandmat manzanita | --/ CNDDB 1B | Closed-cone coniferous forests, maritime chaparral, cismontane woodland, coastal dunes, and coastal scrub on sandy soils at elevations of 3-205 meters. Evergreen shrub in the Ericaceae family; blooms February-May. | **Present:** Observed throughout Fort Ord Dunes State Park (Product Water Conveyance: Coastal alignment option), and near California State University at Monterey Bay (CSUMB) (Product Water Conveyance: RUWAP alignment option) during focused botanical surveys in 2014. |
| *Arenaria paludicola* Marsh sandwort | FE/ SE/ 1B | Known from only two natural occurrences in Black Lake Canyon and at Oso Flaco Lake. Sandy openings of freshwater of brackish marshes and swamps at elevations of 3-170 meters. Stoloniferous perennial herb in the Caryophyllaceae family; blooms May-August. | **Unlikely:** No CNDDB occurrences within quads searched. Suitable habitat is present within the Project Study Area; however, the Project Study Area is not located near the only two occurrences of this species. |
| *Artcostaphylos regismontana* Kings mountain manzanita | --/ CNDDB/ 1B | Broadleaved upland forest, chaparral, and north coast coniferous forest on granitic or sandstone souls at elevations between 305-730 meters. Evergreen shrub in the Ericaceae family; blooms January-April | **Unlikely:** Project Study Area is outside of the species elevation range. |
| *Astragalus tener* var. *tener* Alkali milk-vetch | --/ CNDDB/ 1B | Playas, valley and foothill grassland on adobe clay, and vernal pools on alkaline soils at elevations of 1-60 meters. Annual herb in the Fabaceae family; blooms March-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Astragalus tener* var. *titi* Coastal dunes milk-vetch | FE/ SE/ 1B | Coastal bluff scrub on sandy soils, coastal dunes, and mesic areas of coastal prairie at elevations of 1-50 meters. Annual herb in the Fabaceae family; blooms March-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Bryoria spiralifera* Twisted horsehair lichen | --/ CNDDB/ 1B | California North Coast coniferous forest at an elevation of 0 – 30 meters. Often found on conifers, including *Picea sitchensis*, *Pinus contorta* var. *contorta*, *Pseudotsuga menziesii*, *Abies grandis*, and *Tsuga heterophylla*. Fruticose lichen in the Parmeliaceae family. | **Unlikely:** No suitable habitat present within the Project Study Area. |
| *California macrophylla* Round-leaved filaree | --/ CNDDB/ 1B | Cismontane woodland and valley and foothill grassland on clay soils at elevations of 15-1200 meters. Annual herb in the Geraniaceae family; blooms March-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Castilleja ambigua var. insalutata* Pink Johnny-nip | --/ CNDDB/ 1B | Coastal prairie and coastal scrub at elevations of 0-100 meters. Annual herb in the Orobanchaceae family; blooms May-August. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *Ceanothus cuneatus* ssp. *rigidus* Monterey ceanothus | --/ CNDDB/ 4 | Closed cone coniferous forest, chaparral, and coastal scrub on sandy soils at elevations of 3-200 meters. Evergreen shrub in the Rhamnaceae family, blooms February-April. | **Present:** Observed at the Injection Well Facilities site, throughout Fort Ord Dunes State Park (Product Water Conveyance: Coastal alignment option), within Sand City (CalAm Distribution System: Monterey Pipeline), and near CSUMB (Product Water Conveyance: RUWAP alignment option) during focused botanical surveys in 2009, 2010, and 2014. |
| *Centromadia parryi* ssp. *congdonii* Congdon's tarplant | --/ CNDDB/ 1B | Valley and foothill grassland on alkaline soils at elevations of 1-230 meters. Annual herb in the Asteraceae family; blooms June-November. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Chorizanthe pungens* var. *pungens* Monterey spineflower | FT/ CNDDB/ 1B | Maritime chaparral, cismontane woodland, coastal dunes, coastal scrub, and valley and foothill grassland on sandy soils at elevations of 3-450 meters. Annual herb in the Polygonaceae family; blooms April-June. | **Present:** Observed throughout Fort Ord, near Armstrong Ranch, and on the dunes at the Injection Well Facilities site during focused botanical surveys in 2009, 2010, and 2014. |
| *Chorizanthe robusta* var. *robusta* Robust spineflower | FE/ CNDDB/ 1B | Openings in cismontane woodland, coastal dunes, and coastal scrub on sandy or gravelly soils at elevations of 3-300 meters. Annual herb in the Polygonaceae family; blooms April-September. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Clarkia jolonensis* Jolon clarkia | --/ CNDDB/ 1B | Cismontane woodland, chaparral, riparian woodland, and coastal scrub at elevations of 20-660 meters. Annual herb in the Onagraceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Collinsia multicolor* San Francisco collinsia | --/ CNDDB/ 1B | Closed-cone coniferous forest and coastal scrub, sometimes on serpentinite soils, at elevations of 30-250 meters. Annual herb in the Scrophulariaceae family; blooms March-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Cordylanthus rigidus* ssp. *littoralis* Seaside bird's-beak | --/ SE/ 1B | Closed-cone coniferous forests, chaparral, cismontane woodlands, coastal dunes, and coastal scrub on sandy soils, often on disturbed sites, at elevations of 0-425 meters. Hemi-parasitic, annual herb in the Scrophulariaceae family; blooms April-October. | **High:**. There is a high likelihood Seaside bird's beak may occur within the unsurveyed portion of the Injection Well Facilities site. |
| *Delphinium californicum* ssp. *interius* Hospital Canyon larkspur | --/ CNDDB/ 1B | Openings in chaparral, coastal scrub, and mesic areas of cismontane woodland at elevations of 230-1095 meters. Perennial herb in the Ranunculaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *Delphinium hutchinsoniae* Hutchinson's larkspur | --/ CNDDB/ 1B | Broadleaved upland forest, chaparral, coastal scrub, and coastal prairie at elevations of 0-427 meters. Perennial herb in the Ranunculaceae family; blooms March-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Delphinium umbraculorum* Umbrella larkspur | --/ CNDDB/ 1B | Cismontane woodland at elevations of 400-1600 meters. Perennial herb in the Ranunculaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |
| *Ericameria fasciculata* Eastwood's goldenbush | --/ CNDDB/ 1B | Closed-cone coniferous forest, maritime chaparral, coastal dunes, and openings in coastal scrub on sandy soils at elevations of 30-275 meters. Evergreen shrub in the Asteraceae family; blooms July-October. | **Present:** Observed at the Injection Well Facilities site and near CSUMB (Product Water Conveyance: RUWAP alignment option) during focused botanical surveys in 2014. |
| *Eriogonum nortonii* Pinnacles buckwheat | --/ CNDDB/ 1B | Chaparral and valley and foothill grassland on sandy soils, often on recent burns, at elevations of 300-975 meters. Annual herb in the Polygonaceae family; blooms May-September. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |
| *Erysimum ammophilum* Sand-loving (coast) wallflower | --/ CNDDB/ 1B | Maritime chaparral, coastal dunes, and openings in coastal scrub on sandy soils at elevations of 0-60 meters. Perennial herb in the Brassicaceae family; blooms February-June. | **Present:** Observed near the Naval Postgraduate School (CalAm Distribution System: Monterey Pipeline) during focused botanical surveys in 2009, 2010, and 2014. |
| *Erysimum menziesii* Menzies' wallflower | FE/ SE/ 1B | Coastal dunes at elevations of 0-35 meters. Perennial herb in the Brassicaceae family; blooms March-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Fritillaria liliacea* Fragrant fritillary | --/ CNDDB/ 1B | Cismontane woodland, coastal prairie, coastal scrub, and valley and foothill grassland, often serpentinite, at elevations of 3-410 meters. Bulbiferous perennial herb in the Liliaceae family; blooms February-April. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Gilia tenuiflora* ssp. *arenaria* Monterey (sand) gilia | FE/ ST/ 1B | Maritime chaparral, cismontane woodland, coastal dunes, and openings in coastal scrub on sandy soils at elevations of 0-45 meters. Annual herb in the Polemoniaceae family; blooms April-June. | **High:** There is a high likelihood sand gilia may occur within the unsurveyed portion of the Injection Well Facilities site. |
| *Hesperocyparis goveniana* Gowen cypress | FT/ CNDDB/ 1B | Closed-cone coniferous forest and maritime chaparral at elevations of 30-300 meters. Evergreen tree in the Cupressaceae family. Natively occurring only at Point Lobos near Gibson Creek and the Huckleberry Hill Nature Preserve near Highway 68. | **Not Present:** Not identified during focused botanical survey in 2009, 2010, and 2014. Project Study Area it outside of currently known range for this species. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| *Hesperocyparis macrocarpa* Monterey cypress | --/ CNDDB/ 1B | Closed-cone coniferous forest at elevations of 10-30 meters. Evergreen tree in the Cupressaceae family. Natively occurring only at Cypress Point in Pebble Beach and Point Lobos State Park; widely planted and naturalized elsewhere. | **Not Present:** Project Study Area is outside of currently known range for this species. Although several individuals of this species were observed within the Project Study Area, these individuals are planted specimens or volunteers from planted specimens and are not considered special-status. Therefore, no natively-occurring Monterey cypress trees are present within the Project Study Area. |
| *Holocarpha macradenia* Santa Cruz tarplant | FT/ SE/ 1B | Coastal prairies and valley foothill grasslands, often clay or sandy soils, at elevations of 10-220 meters. Annual herb in the Asteraceae family; blooms June-October. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Horkelia cuneata* var. *sericea* Kellogg's horkelia | --/ CNDDB/ 1B | Closed-cone coniferous forests, maritime chaparral, and openings in coastal scrub on sandy or gravelly soils at elevations of 10-200 meters. Perennial herb in the Rosaceae family; blooms April-September. | **Present:** Observed within the Product Water Conveyance: RUWAP and Coastal alignment options and the Injection Well Facilities site during focused botanical surveys in 2009, 2010, and 2014. |
| *Lasthenia conjugens* Contra Costa goldfields | FE/ CNDDB/ 1B | Mesic areas of valley and foothill grassland, alkaline playas, cismontane woodland, and vernal pools at elevations of 0-470 meters. Annual herb in the Asteraceae family; blooms March-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Layia carnosa* Beach layia | FE/ SE/ 1B | Coastal dunes and coastal scrub on sandy soils at elevations of 0-60 meters. Annual herb in the Asteraceae family; blooms March-July. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Legenere limosa* Legenere | --/ CNDDB/ 1B | Vernal pools and wetlands at elevations of 1-880 meters. Annual herb in the Campanulaceae family; blooms April- June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |
| *Lupinus tidestromii* Tidestrom's lupine | FE/ SE/ 1B | Coastal dunes at elevations of 0-100 meters. Perennial rhizomatous herb in the Fabaceae family; blooms April-June. Only Monterey County plants are state-listed Endangered as var. *tidestromii*. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Malacothamnus palmeri* var. *involucratus* Carmel Valley bush-mallow | --/ CNDDB/ 1B | Chaparral, cismontane woodland, and coastal scrub at elevations of 30-1100 meters. Deciduous shrub in the Malvaceae family; blooms May-August. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Malacothamnus palmeri* var. *palmeri* Santa Lucia | --/ CNDDB/ 1B | Chaparral on rocky soils at elevations of 60-360 meters. Deciduous shrub in the Malvaceae family; blooms May-July. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| bush-mallow | | | |
| *Malacothrix saxatilis* var. *arachnoidea* Carmel Valley malacothrix | --/ CNDDB/ 1B | Chaparral and coastal scrub on rocky soils at elevations of 25-1036 meters. Perennial rhizomatous herb in the Asteraceae family; blooms June-December (uncommon in March). | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Microseris paludosa* Marsh microseris | --/ CNDDB/ 1B | Closed-cone coniferous forest, cismontane woodland, coastal scrub, and valley and foothill grasslands at elevations of 3-300 meters. Perennial herb in the Asteraceae family; blooms April-June (July). | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Monardella sinuata ssp. nigrescens* Northern curly-leaved monardella | --/ CNDDB/ 1B | Closed-cone coniferous forest, chaparral, coastal dunes, coastal prairie, coastal scrub, and lower montane coniferous forest (ponderosa pine sandhills) on sandy soils at elevations of 0-305 meters. Annual herb in the Lamiaceae family; blooms May-September. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Monolopia gracilens* Woodland woolythreads | --/ CNDDB/ 1B | Openings of broadleaved upland forest, chaparral, cismontane woodland, North Coast coniferous forest, and valley and foothill grassland on serpentinite soils at elevations of 100-1200 meters. Annual herb in the Asteraceae family; blooms February-July. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Pinus radiata* Monterey pine | --/ --/ 1B | Closed-cone coniferous forest at elevations of 25-185 meters. Evergreen tree in the Pinaceae family. Only three native stands in CA, at Ano Nuevo, Cambria, and the Monterey Peninsula; introduced in many areas. | **Present:** Several Monterey pine trees are present within the Project Study Area; however, the majority of these individuals are planted specimens or volunteers from planted specimens and are not considered special-status. The only special-status individual of this species is located within the Presidio of Monterey. |
| *Pedicularis dudleyi* Dudley's lousewort | --/ SR/ 1B | Maritime chaparral, cismontane woodland, North Coast coniferous forest, and valley and foothill grassland at elevations of 60-900 meters. Perennial herb in the Orbanchaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Penstemon rattanii var. kleei* Santa Cruz Mountains beardtongue | --/ CNDDB/ 1B | Chaparral and lower montane and North Coast coniferous forests at elevations of 400-1100 meters. Perennial herb in the Plantaginaceae family; blooms May-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |
| *Pentachaeta bellidiflora* White-rayed | FE/ SE/ 1B | Cismontane woodland and valley and foothill grasslands, often on serpentinite soils, at elevations of 35-620 meters. Annual herb in the Asteraceae family; blooms March-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| pentachaeta | | | |
| *Piperia yadonii* Yadon's rein orchid | FE/ CNDDB/ 1B | Sandy soils in coastal bluff scrub, closed-cone coniferous forest, and maritime chaparral at elevations of 10-510 meters. Annual herb in the Orchidaceae family; blooms May-August. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Plagiobothrys chorisianus var. chorisianus* Choris' popcornflower | --/ CNDDB/ 1B | Mesic areas of chaparral, coastal prairie, and coastal scrub at elevations of 15-160 meters. Annual herb in the Boraginaceae family; blooms March-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Plagiobothrys uncinatus* Hooked popcornflower | --/ CNDDB/ 1B | Chaparral, cismontane woodlands, and valley and foothill grasslands on sandy soils at elevations of 300-760 meters. Annual herb in the Boraginaceae family; blooms April-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |
| *Potentilla hickmanii* Hickman's cinquefoil | FE/ SE/ 1B | Coastal bluff scrub, closed-cone coniferous forests, vernally mesic meadows, and freshwater marshes and swamps at elevations of 10-149 meters. Perennial herb in the Rosaceae family; blooms April-August. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Ramalina thrausta* Angel's hair lichen | --/ CNDDB/ 2B | Found in California North Coast coniferous forest at an elevation of 75 - 430 meters. Found on dead twigs, other lichen, and on *Alnus rubra*, *Calocedrus decurrens*, *Pseudotsuga menziesii*,*Quercus garryana*, and *Rubus spectabilis*. It has also been found growing on and amid *Ramalina menziesii* and *Usnea* spp. Fruticose lichen in the Ramalinaceae family. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Rosa pinetorum* Pine rose | --/ CNDDB/ 1B | Closed-cone coniferous forest at elevations of 2-300 meters. Shrub in the Rosaceae family; blooms May-July. Possible hybrid of *R. spithamea*, *R. gymnocarpa*, or others; further study needed. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Sidalcea malachroides* Maple-leaved checkerbloom | --/ CNDDB/ 4 | Broadleaved upland forest, coastal prairie, coastal scrub, north coast coniferous forest, and riparian woodlands, often in disturbed areas, at elevations of 2-700 meters. Perennial herb in the Malvaceae family; blooms April-August. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Stebbinsoseris decipiens* Santa Cruz microseris | --/ CNDDB/ 1B | Broadleaved upland forest, closed-cone coniferous forest, chaparral, coastal prairie, coastal scrub, and openings in valley and foothill grassland, sometimes on serpentinite, at elevations of 10-500 meters. Annual herb in the Asteraceae family; blooms April-May. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Tortula californica* | --/ CNDDB/ | Valley and foothill grassland and chenopod scrub on sandy soils at elevations of 10-1460. Moss in the Pottiaceae family. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014 |

**Table A Revised: Special-Status Species Known or With the Potential to Occur Within the Pure Water Monterey GWR Project Vicinity**

| Species | Status (USFWS/ CDFW/ CNPS) | General Habitat | Potential Occurrence within Project Study Area |
|---|---|---|---|
| California screw moss | 1B | | |
| *Trifolium buckwestiorum* Santa Cruz clover | --/ CNDDB/ 1B | Broadleaved upland forest, cismontane woodland, and margins of coastal prairie on gravelly soils at elevations of 105-610 meters. Annual herb in the Fabaceae family; blooms April-October. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Trifolium hydrophilum* Saline clover | --/ CNDDB/ 1B | Marshes and swamps, valley and foothill grassland (mesic, alkaline), and vernal pools at elevations of 0-300 meters. Annual herb in the Fabaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Trifolium polyodon* Pacific Grove clover | --/ SR/ 1B | Closed-cone coniferous forest, coastal prairie, meadows and seeps, and mesic areas in valley and foothill grassland at elevations of 5-120 meters. Annual herb in the Fabaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |
| *Trifolium trichocalyx* Monterey clover | FE/ SE/ 1B | Sandy openings and burned areas of closed-cone coniferous forest at elevations of 30-240 meters. Annual herb in the Fabaceae family; blooms April-June. | **Not Present:** Not identified during focused botanical surveys in 2009, 2010, and 2014. |

*This Page Left Intentionally Blank*

# Wildlife Species Observed Within and Immediately Adjacent to the Monterey Peninsula Groundwater Replenishment Project

| Scientific Name | Common Name |
|---|---|
| **Mammals** | |
| *Mephitis mephitis* | Skunk |
| *Neotoma fuscipes luciana* | Monterey dusky-footed woodrat* |
| *Otospermophilus beecheyi* | California ground squirrel |
| *Peromyscus* sp. | Mouse |
| *Sylvilagus bachmani* | Brush rabbit |
| **Birds** | |
| *Agelaius phoeniceus* | Red-wing blackbird |
| *Anas platyrhynchos* | Mallard |
| *Anas strepera* | Gadwall |
| *Ardea herodias* | Great blue heron |
| *Branta canadensis* | Canada goose |
| *Calidris pusilla* | Semipalmated sandpiper |
| *Callipepla californica* | California Quail |
| *Calypte anna* | Anna's hummingbird |
| *Carduelis psaltria* | Lesser goldfinch |
| *Cathartes aura* | Turkey vulture |
| *Chamaea fasciata* | Wrentit |
| *Charadrius vociferus* | Killdeer |
| *Cistothorus palustris* | Marsh wren |
| *Colaptes auratus* | Northern Flicker |
| *Corvus brachyrhynchos* | American crow |
| *Elanus leucurus* | White-tailed kite** |
| *Euphagus cyanocephalus* | Brewer's blackbird |
| *Fulica americana* | American Coot |
| *Haemorhous mexicanus* | House finch |
| *Himantopus mexicanus* | Black-necked stilt |
| *Hirundo rustica* | Barn Swallow |
| *Limnodromus* sp. | Dowitcher |
| *Melospiza melodia* | Song sparrow |
| *Mergus merganser* | Common merganser |
| *Nycticorax nycticorax* | Black-crowned night heron*** |
| *Oxyura jamaicensis* | Ruddy duck |
| *Passer domesticus* | House sparrow |
| *Phalacrocorax penicillatus* | Brandt's cormorant |
| *Pipilo maculatus* | Spotted towhee |
| *Poecile rufescens* | Chestnut-backed chickadee |
| *Recurvirostra americana* | American avocet |
| *Sayornis nigricans* | Black phoebe |
| *Spizella pusilla* | Field sparrow |
| *Sturnella neglecta* | Western meadowlark |

# Wildlife Species Observed Within and Immediately Adjacent to the Monterey Peninsula Groundwater Replenishment Project

| Scientific Name | Common Name |
|---|---|
| *Sturnus vulgaris* | European Starling |
| *Tachycineta bicolor* | Tree swallow |
| *Toxostoma redivivum* | California thrasher |
| *Troglodytes aedon* | House wren |
| *Turdus migratorius* | American robin |
| *Zenaida macroura* | Mourning dove |
| *Zonotrichia leucophrys* | White-crowned sparrow |
| **Reptiles & Amphibians** | |
| *Crotalus oreganus oreganus* | Northern Pacific rattlesnake |
| *Elgaria multicarinata multicarinata* | California alligator lizard |
| *Pituophis catenifer catenifer* | Pacific gopher snake |
| *Sceloporus occidentalis bocourtii* | Coast range fence lizard |

**Notes**

*Several nests observed

**Observed overhead and adjacent to project site

***Observed overhead and adjacent to source water diversion site

# THE BIRDS OF FORT ORD EAST OF ROUTE 1

Revised 5 Feb 07

David Styer with historic data provided by Don Roberson

An asterisk (*) after a bird's name means that the species was probably breeding, or confirmed breeding on Fort Ord east of Route 1. This list is based almost entirely on my own inventories. These have taken place during the following time periods: 25 Feb - 16 Jun 96, 9 Jul - 16 Aug 97, 27 Jun - 16 Aug 98, 27 Jul - 19 Aug 99, 7 Jun - 28 Jun 00, 5 Feb 01 - 3 Mar 01, 17 Sep 01 - 2 Nov 01, 13 Dec - 31 Dec 01, and most of 2002 and 2003. In 2004–2006 only the more outstanding sightings were noted. The few records based on other people's sightings are noted. All collective references to Christmas Bird Counts (CBCs) refer to the nine Monterey CBCs provided by Roberson. This count takes place in a 15-mile diameter circle that includes the southwest portion of Ft. Ord.

| | | |
|---|---|---|
| 1. | Cackling Goose | 1 record: 1 seen by D. Roberson's CBC group on 29 Dec 00. |
| 2. | Canada Goose* | Seen in small numbers. Nested, but unsuccessfully in 2002. Successfully nested at Machine Gun Flats in 2005. |
| 3. | Wood Duck | The first record was 5 males at Boy Scout Lake on 12 Oct 05. Some were seen there until 7 Dec 05. |
| 4. | Gadwall* | The first record was five seen on 8 Aug 98 on a vernal pond. Expected in small numbers. In 2002 there were 3 records from 12 Mar to 24 Mar, and 5 records from 29 Aug to 29 Oct, all at Mudhen Lake. Seen in January and December in 2003.Nested on Machine Gun Flats in 2005; young noted on 22 May 05. |
| 5. | American Wigeon | Winter visitor. A pair was on Mudhen Lake on 18 Feb 01; 3 were there on 23 Mar 02, and 1 to 2 pairs were there from 23 Nov 02 through 31 Jan 03. Seen regularly at the vernal pools 29 Jan 05 through 2 Apr 05. Also, seen regularly at Boy Scout Lake Nov and Dec 05, with approximately 10 there on 13 Dec. |
| 6. | Mallard* | Seen on ponds through year. Young seen on Mudhen Lake 6 Jun 96 and on Boy Scout Pond on 2 Jun 96. Young seen on several ponds in 1998. One hundred to three hundred regularly visited Mudhen Lake in the fall of 2001. There were 87 visiting the vernal pool at Machine Gun Flats on 2 Mar 04. Bill Collins saw around 500 on the pond behind Range 37 in the fall of 2000. Ronnie L. Ryno found young at Mudhen Lake on 9 Jun 89 during the Monterey County Breeding Bird Atlas project. |
| 7. | Cinnamon Teal | First record: 1 male on the pond behind Range 37 on 31 Mar 96. Two spent most of Aug 99 on Fox Pond. There were several records in Mar 05, and 3 were on Mudhen Lake on 21 Jul 05.In early 2006 they were seen on Boy Scout Lake:2 on 24 Jan and 4 on 21 Feb. |
| 8. | Northern Shoveler | A pair was at Mudhen Lake on 29 Oct 01, 6 were there 6 Oct 02 and 3 were there on 25 Oct 05. |
| 9. | Northern Pintail | First record: 3 females on Mudhen Lake on 22 Oct 01. Six were there, including a male, on 2 Nov 01, 2 were there on 22 Oct 02, and a pair was at Boy Scout Lake on 13 Dec 05. |

| | | |
|---|---|---|
| 10. | Green-winged Teal | A pair was at Mudhen Lake from 30 Mar to 7 Apr 96. They visited Mudhen Lake in early Nov 02, and 20 were there on 5 Nov 02. On 12 Dec 05 19 males were on Mudhen Lake. The next day a flock of 35 (males and females) were on Boy Scout Lake. They were seen there in dwindling numbers up until 21 Feb 06. |
| 11. | Redhead | A male was seen at Mudhen Lake from 13 Dec 01 through 4 Feb 02. |
| 12. | Ring-necked Duck | An occasional fall and winter visitor. 1st record: 1 male in holding pond near west end of Eucalyptus Rd. on 28 Jun 98.There were 5 females on Mudhen Lake on 20 and 27 Nov, and 1 male there on 1 Dec 06. Notably, Bill Collins saw around 35 in the pond behind Range 37 in the fall of 2000. |
| 13. | Greater Scaup | 1 record: 1 female in the holding pond at the west end of Eucalyptus Road on 26 Oct 01. |
| 14. | Bufflehead | One female spent the entire summer of 1998 on the same pond (see ring-necked Duck). 2 females were on the same pond in Jan 03. A pair was on Machine Gun Flats on 22 Feb 05. |
| 15. | Common Goldeneye | Seen in winter 1996 on above-mentioned pond before inventory started, and in Dec 01. |
| 16. | Hooded Merganser | 2 records: One immature male on Mudhen Lake 25 Feb - 24 Mar 96, and 1 female on Mudhen Lake on 24 Nov 06. |
| 17. | Common Merganser | 1 record: seen in the Salinas River on 30 Apr 05. |
| 18. | Ruddy Duck | Occasional visitor. 2 males on the vernal pool on Machine Gun Flats on 17 Jul 98, and 1 female on the Catfish Pond on 18 Oct 02.Two females spent much of Dec 05 on Mudhen Lake. A resident of Mudhen Lake beginning 9 Oct 06. |
| 19. | Wild Turkey* | Seen irregularly during the inventory. Dick Pitschka and I saw 3 adult females and 7 young across Jacks Road from Mudhen Lake on 21 Jun 00. Noticeably more common by 2001 than in the past. In 2003 and 2004, 2 or 3 flocks of up to 20 were seen, and they continue to have young. |
| 20. | California Quail* | Seen, except in the most open grassland, throughout Ft. Ord, throughout the inventory. Possibly increasing: in 1996 most coveys with 10 or fewer birds. In 2001 many coveys with 10 to 20 birds. They continue roughly the same size through 2006. I have been told that coveys with a 100 California Quail were common in the past. |
| 21. | Loon species | 2 flew over the BLM office area on 2 Nov 01. |
| 22. | Pied-billed Grebe* | Seen throughout the year on permanent ponds. In 1996 and 1997 young produced only on Mudhen Lake. In 1998 young were produced on at least four vernal ponds. |
| 23. | Eared Grebe | 2 records: 1 stayed at the holding pond on the west end of Eucalyptus Road from 4 Oct to 11 Oct 01, and 1 was on Mudhen lake from 15 Nov 05 through 29 Nov 05. |

| | | |
|---|---|---|
| 24. | Double-crested Cormorant | Winter visitor to Mudhen Lake. Seen late December through March, irregularly until May. Up to 5 have been seen at once. On 30 Nov 06 30 flew over Mudhen Lake. |
| 25. | American Bittern | 1 record: 1 seen at Mudhen Lake on and around 7 Aug 99. |
| 26. | Great Blue Heron | One or two regularly visit the permanent ponds. |
| 27. | Great Egret | Occasional visitor to the permanent ponds. 1 frequently seen at the dwindling Mudhen Lake in 2003. One at a puddle in East Garrison on 22 Mar 05 was a surprise. |
| 28. | Green Heron | 4 records prior to 2006: 1 seen by Sam Fitton on 6 Apr 98, 1 seen at Mudhen Lake 11 Jun 02, 1 seen by Steve Moore at the pond on Crescent Bluff Road on 25 Apr 03, and 1 flew from Toro Creek Pond on 7 Jul 05. Bruce Gerow saw them regularly at the mouth of El Toro Creek, just off Ft. Ord. There were 5 records at Mudhen Lake and Boy Scout Lake in 2006. |
| 29. | Turkey Vulture | Seen throughout Ft. Ord throughout the year, although uncommon in the backcountry in the fall. Possibly breeding, but not confirmed, although evidence continues to build. Numbers on CBCs have increased almost steadily from 1 in 1984 to 17 in 2001. |
| 30. | Osprey | 1st record: 1 eating on top of high-tension tower by Range 45 on 6 Apr 96. 1 flew over Mudhen Lake on 19 Oct 01. In 2002 Osprey were seen on 4 Jan, 8 Jan, and 11 Apr. In 2003 there were 3 records: 1 on 3 Jan at Mudhen Lake, 1 in April flying over Ingman Court, and 1 on 3 May at El Toro Creek. Again, one was seen at Mudhen Lake on 3 Jan 04. |
| 31. | White-tailed Kite* | Seen in small numbers (1 or 2) over grasslands and vernal pools. In the spring of 1998 Roberto Maceira saw approximately 10 spending the day by one pool, and in the summer of 2006 Tim Buhl saw a group of 11, including young. |
| 32. | Bald Eagle | An immature bird was seen at Mudhen Lake in the spring of 1999. On 4 Mar 02 Bill Collins saw 1 subadult on Machine Gun Flats. |
| 33. | Northern Harrier | A winter resident on the grasslands, and an occasional migrant elsewhere. 1 to 3 are usually seen in grasslands. One summer record: 1 on 8 Jul 98. |
| 34. | Sharp-shinned Hawk | Fairly common fall migrant, arriving in Sep, and uncommon spring migrant. Also seen on 1 and 2 Aug 99. A winter resident in 2003 and 2004. |
| 35. | Cooper's Hawk* | Seen throughout the inventory, and widely, but thinly spread over Ft. Ord. |
| 36. | Red-shouldered Hawk* | Common year-round in the "front" of Ft. Ord, near housing. Seen less in other locations. Ronnie L Ryno observed an occupied nest near Mudhen Lake 16 Apr 86. |

| | | |
|---|---|---|
| 37. | Red-tailed Hawk* | Seen throughout Ft. Ord throughout the year. Eleven Red-tailed Hawks wheeling over the BLM office on 25 Jul 98 was an extraordinary sight. Nests are seen regularly; for example, Ronnie L. Ryno saw on occupied nest on 16 Apr 86. Usually around 10 are seen on CBCs, but on 28 Dec 84 there were 25 counted. |
| 38. | Ferruginous Hawk | 2 records: Don Roberson saw one in the Grasslands on 28 Dec 84, and I saw 1 near Imjin Rd. on 14 Apr 02. |
| 39. | Golden Eagle | 1st record: 1 over grassland, Oil Well Rd., on 6 Apr 96. An uncommon fall migrant, rare in other seasons. Seen in February, March, and September in 2003. One was seen on the CBC on 29 Dec 00, and on Lightfighter Road during the CBC on 27 Dec 05. |
| 40. | Crested Caracara | 1 record: Tim Buhl saw 1 fly across Highway 1 on 11 Sep 06. |
| 41. | American Kestrel* | Seen throughout the year. Perhaps 4 to 8 pairs breed on Ft. Ord. Especially visible on the grasslands. On the 9 CBCs the low count was 4 and the high count was 14. |
| 42. | Merlin | Uncommon migrant or winter visitor:1 was seen near Laguna Seca during the CBC on 27 Dec 89. 1 at Machine Gun Flats on 9 Mar 96 and on 11 Jan 02, 1 on First Ave. on 19 Oct 01, 1 at Parker Flats on 30 Dec 03, and 1 by Fox Pond on 9 Dec 04. 1 was seen at El Toro Creek on 26 Feb 05, and another was seen at Machine Gun Flats on 25 Mar 05. |
| 43. | Peregrine Falcon | One seen circling over First Ave. on 4 Oct 01. |
| 44. | Prairie Falcon | 3 records: 1 seen at Machine Gun Flats on 19 Oct 01, 1 seen by Bill Reese on 27 Dec 04, and 1 was seen flying over Old Reservation Rd. on 30 Aug 06. |
| 45. | Virginia Rail | 1 record: 1 first heard on 28 Oct responded repeatedly to a taped call on 30 Oct 06. |
| 46. | Sora | Few records: 1 on pond behind Range 37 on 31 Mar 96; 1 seen on Mudhen Lake on 1 and 2 Mar 01, and 1 was at the Catfish Pond much of Oct 04. They were heard from 21 Oct to 13 Nov 06 on Mudhen Lake, with a maximum of 3 heard on 26 Oct. |
| 47. | Common Moorhen | 2 records of single individuals on Mudhen Lake: on 23 Oct 01, and seen from16 Oct to 23 Oct 06. |
| 48. | American Coot* | In 1996 common through April, then most gone. Approximately 2 young produced in 1996 and 1997. In 1998 seen in summer on at least 6 ponds, with at least 25 young produced. In the dry year, 2001, only a pair at the Catfish Pond produced young (5). By summer 2004 all ponds except the Catfish Pond had dried, so Coots could only be seen there. Coots returned to the refilled Mudhen Lake by 25 Mar 05, and approximately 40 were seen there on 14 Nov 06. |

| | | |
|---|---|---|
| 49. | Killdeer | Seen at Mudhen Lake through Mar 96, but not later that year. Up to 8 seen at the vernal pool behind the BLM buildings in July and August of 1998. Larger numbers, e.g., 26 on 11 Dec 02, seen in fall or winter in fields such as Parker Flats. |
| 50. | Spotted Sandpiper | 1 record: 2 in breeding plumage at Fox Pond on 4 Jul 98. |
| 51. | Solitary Sandpiper | 3 records: 1 bird at vernal pond behind BLM headquarters on 1 Aug 98, 1 at the Catfish Pond on 29 Jul 03, and there was also 1 on the Salinas River at the mouth of El Toro Creek on 3 May 03. |
| 52. | Greater Yellowlegs | 2 March records in 1996: 6 on Reserve 12 on 9 Mar and 1 heard at Mudhen Lake on 24 Mar. Seen visiting the mud-flats behind the BLM buildings in July and August of 1998, at Fox Pond in Aug 99, 3 on Machine Gun Flats on 11 Jan 02. Visited Mudhen Lake and Machine Gun Flats in March, April, October, and November in 2003. There were 14 on Machine Gun Flats on 2 Mar 04, and 22 on 14 Mar 05.1 flew over South Boundary Road during the CBC on 29 Dec 00. |
| 53. | Whimbrel | 1 record: on 29 Jul 03 one flew over me on Parker Flats Road, and circled around and called. |
| 54. | Western Sandpiper | 1 record: 1 at Fox Pond on 14 Aug 99. |
| 55. | Least Sandpiper | 1 stayed at Fox Pond in 1999. First record: 31 Jul 99. Mary Paul saw 2 at Boy Scout Lake on19 Dec 05, and 1 was seen at the pond by Riso Ridge Road on 13 Nov 06. |
| 56. | Long-billed Dowitcher | Visitors to Fox Pond in 1999. I saw 1 on 5 Aug, the first record, and 10 or more on 18 Aug. |
| 57. | Wilson's Snipe | Steve Moore and Suzy Worcester have seen several at vernal pools; e.g., they saw 1 at Twin Pond on 6 Apr 03. In 2004 there was 1 at Machine Gun Flats on 22 Apr, and there were 2 at the Catfish Pond on 16 and 21 Oct. 3 records in 2005: 10 were counted at Machine Gun Flats on 29 Jan, 2 at Mudhen Lake on 29 Oct, and 1 at Toro Creek Pond on23 Nov. One was at Machine Gun Flats on 23 Jan 06. |
| 58. | Wilson's Phalarope | First record: 1 immature bird on pond behind BLM office on 2 Aug 98.There were 3 on Fox Pond in Aug 99. |
| 59. | Red-necked Phalarope | 3 on the pond on Reserve 5 on 26 Jul 97, up to 19 on Fox Pond in Aug 99, and up to 6 on Mudhen Lake in Aug 06. |
| 60. | Red Phalarope | 1 record: 1 seen by Bill Reese's CBC group on Mudhen Lake on 27 Dec 05. |
| 61. | Mew Gull | 1 record: a large and varied group of gulls were on top of the Commissary building during the CBC count on 28 Dec 84, when Ft. Ord was an active military base. There were 130 of these gulls. |
| 62. | California Gull | Several are regularly seen flying over Ft. Ord and visiting such places as Burger King in fall and winter. Don Roberson saw 1105 on the commissary roof during the CBC on 28 Dec 84. |
| 63. | Herring Gull | 1 record: 38 on 28 Dec84 (see comment at Mew Gull). |

| | | |
|---|---|---|
| 64. | Thayer's Gull | 1 record: 1 adult on 28 Dec84 (see comment at Mew Gull). |
| 65. | Western Gull | 2 records: Don Roberson counted 159 on the Commissary roof during the 28 Dec 84 CBC, and a flock of approximately 6 were seen flying over CSUMB on 19 Jul 98. |
| 66. | Glaucous-winged Gull | 1 record: 1 on 28 Dec84 (see comment at Mew Gull). |
| 67. | Black-legged Kittiwake | 1 record: an exhausted individual found by Shirley Tudor in the Inland Ranges on 25 Feb 11. |
| 68. | Elegant Tern | 2 records: Sam Fitton heard 1 on 26 Jul 97, and Bruce Gerow heard 1 on 1 Aug 98. |
| 69. | Rock Pigeon* | In spite of being common in the housing areas of Ft. Ord, they are infrequently seen in the interior backcountry. There are a few records each year. |
| 70. | Band-tailed Pigeon | Chuck Haugen had seen them along El Toro Creek. Charlie Saunders and I saw 5 on 18 Mar 03 flying over Trail 22. Following that, I saw 24 on 9 May, 7 on 16 Jun, and 3 on 11 Nov 03. In 2006 there were 6 at the BLM Offices on 4 Jan, 10 at Engineer Canyon Road on 8 Mar, and 30 down from Mudhen Lake on 5 Apr. Fifteen were seen on the CBC on 27 Dec 96. |
| 71. | Eurasian Collared-Dove | |
| 72. | Mourning Dove* | Seen, usually 1 to 4 at a time, throughout the inventory and in all areas. On 24 Jul 97, Robin Whatley and I counted over 60 in one spot along Oil Well Road, and I saw approximately 60 by Eucalyptus Road on 15 Oct 06. Less common in the dry years of 2002 and 2003, but a flock of 30 was seen in the grasslands on 2 Dec 03. |
| 73. | Greater Roadrunner* | Few records: near Mudhen Lake: 1 heard on 6 Apr 96 and 1 heard on 2 Nov 01. Also seen by Barloy Canyon Road and Trail 22 in the spring of 2002. People have said they see them down Crescent Bluff Road, and Engineering Canyon Road. Steve Moore and Eric Morgan independently saw 1 at Machine Gun Flats on 19 Apr 03, our only 2003 record. A Roadrunner on Eucalyptus Road entertained the volunteers on 18 May 04. Tammy Jakl saw 1 on Trail 10 on 26 Oct 05. Ronnie Ryno saw 1 near Mudhen Lake on16 Apr 89. Don Roberson saw 2 on the CBC on 28 Dec 84, and 1 on the CBC on 28 Dec 99. |
| 74. | Barn Owl* | Resident, but few seen. In Aug 98 they were found to come out at dusk over the grasslands at Skyline and Oil Well Roads, and hover like Red-tailed Hawks. [Id. aided by Sam Fitton.] In Jul 06 Wendi Wendt showed us a cliff-side nest with 4 young. |
| 75. | Western Screech-Owl* | Resident. Seen once or twice each year, including an adult and 1 young on 26 Jul 97. |
| 76. | Great Horned Owl* | A permanent resident, and breeding bird, seen throughout Ft. Ord. At least 5 pairs live in the vicinity of Eucalyptus Road. Mark Littlefield observed a nest with young on25 Feb 91. |

| | | |
|---|---|---|
| 77. | Burrowing Owl | Jack Massera reported that they used to live in the grasslands. Bruce Delgado saw 2 in Nov 97. The Fittons and I looked for them on 15 Aug 98, and we found pellets that were no more than a week old [*fida* Sam Fitton]. The volunteer group saw 1 on 4 Feb 03 near the corner of Skyline and Guidotti Roads. In late Oct 05 Jessie Quinn saw 3 or 4, and Phil Smith found 1 that stood by its hole under a Coyote Brush bush. Smith reported at least 12 on a subsequent trip that winter (2005-06). Observed on the 1993, 1994, 1998, 2005, and 2006 CBCs. |
| 78. | Common Poorwill* | In the chaparral throughout the inventory. Infrequently calls in July and August. Heard calling as early as 31 Jan 03. In fall they are seen but not heard. Late records: 6 on 20 Oct 01, and 4 on 28 Oct 06. |
| 79. | Vaux's Swift | |
| 80. | White-throated Swift | Appears to be nesting under the highway bridges adjacent to Ft. Ord. Seen widely over Ft. Ord on 19 Feb 01, as in a migration. Seen throughout the year, but usually scarce in winter. One was seen on the CBC of 29 Dec 94. They were common on the Reservation Road bridge over El Toro Creek in the fall of 2006, with at least 28 seen on 16 Nov, and seen until my last trip to the area on 24 Dec. |
| 81. | Anna's Hummingbird* | One to several seen everywhere except pure grassland throughout the year. Most actively breeding in winter. Ronnie Ryno saw an occupied nest on 8 May 89, and I watched nest activity at the BLM office area from 5 Jan to 16 Feb 06. Usually between 40 and 70 individuals have been counted on the CBCs, but 179 were noted on the 1984 CBC. |
| 82. | Rufous Hummingbird | Bruce Gerow said that a big migratory wave of Rufous Hummingbirds passed through Ft. Ord in April 1989. |
| 83. | Allen's Hummingbird* | Seen at BLM compound in 1996 and at the Catfish Pond from 16 Mar to 8 Jun 03, and again in 2004, starting 15 Feb. In 2004, also noted in the BLM office area on 11 Feb, and along El Toro Creek on 10 Mar. |
| 84. | Belted Kingfisher | One or two seem to visit Ft. Ord regularly, except during the breeding season. Seen most regularly at Mudhen Lake. They are more regular, and possibly nesting, in the Salinas River area, a region not inventoried prior to 2006. |
| 85. | Lewis's Woodpecker | From 20 Dec 93 to 6 May 94 there were "dozens" on eastern Ft. Ord. For example, 5 were seen on the CBC on 28 Dec 93. [See Don Roberson, *Monterey Birds,* $2^{nd}$ Edition, 2002.] Tim Buhl saw 1 at the Catfish Pond on 2 Oct 03. It was still there the next day. |
| 86. | Acorn Woodpecker* | In 1996 most individuals were along El Toro Creek. In 1998 there was a small colony next to Mudhen Lake. In the falls of 2001 and 2005, strong acorn years, Acorn Woodpeckers were widely distributed all over Ft. Ord. One to five could be seen in many places. By the end of the dry, low yield year, 2002, Acorn Woodpeckers were again scarce on Ft. Ord, with a total of 2 at Mudhen Lake. |

| | | |
|---|---|---|
| 87. | Red-breasted Sapsucker | 3 records of 1 near Mudhen Lake: 7 Apr 96, 12 Nov 02, and 21 Oct 06. In 2003 there were 3 records of 1 in the BLM office area: 4 Mar, 18 Mar, and 31 Dec. Not seen on CBCs. |
| 88. | Nuttall's Woodpecker* | Seen in oak trees throughout the year. Usually just 1 or 2 seen. Perhaps more easily seen in sycamore trees along El Toro Creek. Anywhere from 1 to 8 have been seen on CBCs. |
| 89. | Downy Woodpecker* | Thinly spread over riparian locations throughout the year. At most 2 have been seen on any CBC, but the count circle excludes most of the riparian areas of Ft. Ord. |
| 90. | Hairy Woodpecker* | Widely distributed on Ft. Ord in very small numbers. For example, a pair can usually be seen at Mudhen Lake. Much more widely distributed in the fall of 2001. At most 3 have been noted on any CBC. |
| 91. | Northern Flicker* | Seen throughout oak savannah throughout the inventory. Up to 10 seen per field trip. From 10 to 20 have been noted on most CBCs. |
| 92. | Olive-sided Flycatcher* | Uncommon spring migrant; 3 records of 1 each: on Crescent Bluff Rd. on 28 Apr 96, at El Toro Creek on 7 May 02, and Machine Gun Flats on 14 May 03. In 2004 through 2006 a pair nested in the BLM office area. On 13 Jul 04 an adult was seen with 2 fledglings. |
| 93. | Western Wood-Pewee | 4 records: 1 seen at the camp ground by West Camp Street on 15 Aug 99, and 1 May 03 (singing), 2 at the BLM office area on 8 May 03, and Bruce Gerow saw 1 at Mudhen Lake on 21 Apr 04. |
| 94. | Gray Flycatcher | 1 record: Jane Styer and I saw one near Skyline Road on 2 May 03. |
| 95. | Pacific-slope Flycatcher* | Summer resident in trees in riparian locations. First spring record: 17 Mar 04. In 1998 nested under eaves at front entrance to BLM main building. The latest annual record was 1 seen 27 Sep 01. Early arrival in 2004 with 3 March records; and in 2005 with arrival noted on 25 Mar. |
| 96. | Black Phoebe* | 1 or 2 pairs are seen at most riparian locations throughout the year. On CBCs prior to 1999 fewer than 8 individuals were noted per count; from 1999 on 10 or more have been noted per count |
| 97. | Say's Phoebe | Winter resident on grasslands: last seen on 7 May 02. First fall record: 10 Sep 02. Usually fewer than 5 seen on one field trip. Usually 5 to 15 individuals have been seen per CBC. |
| 98. | Ash-throated Flycatcher* | Summer resident throughout oak-chaparral. First spring record: 2 Apr 05. Infrequently seen in August. Latest record: 13 Aug 02. |
| 99. | Cassin's Kingbird | Bruce Gerow saw 1 very vocal bird on Ft. Ord near the Toro Estates Entrance from 19 to 21 May 01. Another vocal bird was seen at Boy Scout Lake on 19 Aug 05. |

| | | |
|---|---|---|
| 100. | Western Kingbird* | 1 or 2 pairs breed on the grasslands near El Toro Creek. The 1st spring records are usually in early April. Seen on 27 Mar 04. A "fall" migrant was on Machine Gun Flats on 2 Aug 99. Bruce Gerow confirmed breeding in 2001. |
| 101. | Loggerhead Shrike | Not seen in 1996. Uncommon, but widely distributed in somewhat open areas since then. |
| 102. | Hutton's Vireo* | Year-round resident in the Coast Live Oaks. When they are singing I can usually detect 1 to 4 individuals in one place. Most CBCs have recorded between 2 and 7 individuals. |
| 103. | Warbling Vireo* | Likely breeding in dense willow locations. Seen only in spring, and in drier years likely only a migrant. Earliest records: 27 Apr 02, 21 Apr 04, and 18 Apr 05. I was surprised that there was one at the Dam Crossing on 22 Jun 04. |
| 104. | Steller's Jay | Usually associated with El Toro Creek community, first recorded on Ft. Ord on 27 Jul 97. Widely distributed over Ft. Ord in the fall of 2001, a good acorn year. Noted around Mudhen Lake in November and December 05. |
| 105. | Western Scrub-Jay* | Highly visible common bird throughout the oak-chaparral throughout the inventory. The CBCs have recorded between 32 and 90 individuals. |
| 106. | American Crow* | Although abundant in the housing areas on Ft. Ord, it is uncommon in the backcountry. The CBCs have recorded between 16 and 90 individuals. |
| 107. | Common Raven | Infrequent visitor. Bruce Gerow saw two fly over the vicinity of Mudhen Lake in the spring of 1999. From then through 2003 I have widely scattered records: 10 Jun 00, 21 Oct 01, 3 May 02, 8 Aug 02, 17 Nov 02, 21 May 03, and 11 Sep 03. The six records in 2004 of up to 5 individuals suggest a population increase. In 2005 there were 4 records, and in 2006 there were 11 records of 1 to 4 individuals. |
| 108. | Horned Lark* | Seen in high grassland throughout the year. Young birds observed in June and July. They appear to be much more common in winter. They were uncommon in 2002. Five of the 9 CBCs have recorded no Horned Larks. The 28 Dec 93 CBC recorded 69 larks, far more than any other Ft. Ord count. |
| 109. | Purple Martin | 1 record: four flew west over Mudhen Lake on 14 Aug 99. |
| 110. | Tree Swallow* | Seen at ponds in small numbers. In 1996 first seen on 9 Mar, in 2001 on 12 Feb, in 2002 on 8 Feb, and in 2003 on 9 Mar. In July/August inventories, not seen in 1997, and last seen on 12 Jul 98, 1 Oct 01, 15 Jun 02, and 8 Jun 03. A possible migration peak in April. Three were seen on the 29 Dec 98 CBC. |

| | | |
|---|---|---|
| 111. | Violet-green Swallow* | At ponds in small numbers during the winter/spring inventory of 1996. Early record: 10 Feb 01. Around 60 birds seen on 2 Mar 01. Rarely seen in summer. In 2002 seen regularly from 6 Mar until 11 Jun, but not otherwise. In 2003 and 2004 seen until mid-June, probably nesting in a cliff face on Barloy Canyon Road. Also, 4 seen on the 29 Dec 98 CBC, and 3 were at Mudhen Lake on 30 Dec 03. |
| 112. | Northern Rough-winged Swallow | Seen in small numbers from early March (5 Mar 02) to early July (8 Jul 98). Seen as early as 12 Feb 01. |
| 113. | Cliff Swallow* | Summer resident. Until 2003 the early inventory date was 2 May 02. In 2003 approximately 50 were flying along El Toro Creek on 6 Apr, and in 2004 they were seen as early as 15 Mar. The most common swallow into August. Not seen in Sep 01, and last seen on 7 Aug 02, 12 Aug 03, and 19 Aug 05. |
| 114. | Barn Swallow* | Summer resident with nests observed. Usually first seen in March. One individual was seen on 20 Jan 06. Seen over the grasslands as well as over ponds. The 20 Barn Swallows seen over the vernal pond behind the BLM office appeared migratory. In Aug 04 a flock settled around the corner of Eucalyptus and Parker Flats Roads. Approximately 60 were seen there on the 20th. Some last records for the year are: 22 Sep 01, 12 Sep 02, and 12 Aug 03. One was seen on the 29 Dec 98 CBC. |
| 115. | Chestnut-backed Chickadee* | Seen throughout the inventory in scattered localities where there are oak trees. Up to 10 may be seen in a given location. The 1993 CBC reported 43 individuals, but the count has usually seen fewer than 15. |
| 116. | Oak Titmouse* | Common in the oaks and riparian woods throughout the year. Usually fewer than 10 are seen. The 1993 CBC reported 54 titmice, all other CBCs found 17 or fewer individuals. |
| 117. | Bushtit* | Common throughout the year wherever there are trees or chaparral. Usually seen in flocks (of up to 30 birds). Usually 100–200 are seen during CBCs, but 326 were counted on 28 Dec 84. |
| 118. | Red-breasted Nuthatch | Infrequent winter resident, noted on several CBCs.: 1 in '96, 2 on the golf course in '98, 3 in '00, and 1 seen near BLM office on 28 Dec 01. A small "wave" came through in the fall of 2004, with the 1st heard in Coast Live Oaks on 29 Sep., and one wintered in the BLM office area and was last seen on 30 Apr 05. |
| 119. | White-breasted Nuthatch | 5 records: 1 or 2 in the Valley Oaks near El Toro Creek on 27 Jul 97, 15 Aug 99, and 28 Oct 03; one was seen near El Toro Creek on 18 Sep 01. One was in the Coast Live Oaks at Boy Scout Lake on 16 Nov 05 |
| 120. | Pygmy Nuthatch* | 1 record prior to 2006: Don Roberson saw 2 on the golf course on the CBC on 28 Dec 99. On 6 Mar 06 a pair was seen mating in the pine planting along South Boundary Road. On 5 Jun they were seen feeding fledglings in the same location. |

121. Brown Creeper

Uncommon winter resident. They have been seen at the golf course on several CBCs: 1998. 2000, and 2005. There was 1 at BLM offices from 11 Dec 02 until 28 Jan 03.

122. Rock Wren

One was in an eroded area not far from the top of Oil Well Road, seen on 21 and 27 Oct 01.

123. Bewick's Wren*

Common in the trees, brush, and chaparral throughout the inventory. During the height of song one may hear roughly 10 singing. On CBCs anywhere from the teens to the 30s have usually been recorded. On 28 Dec 93 52 were counted.

124. House Wren*

Seen in riparian locations from March until July. Latest records: 19 Aug 99, 13 Oct 02, and 17 Oct 06. Less frequent, and last noted on 17 May, in the dry year 2004.

125. Marsh Wren

One singing on Mudhen Lake 25 Feb to 2 Mar 01, and 1 at the Catfish Pond in the fall (8 Oct) of 2002, in Mar 03, and Oct 04. Previously seen by Bill Collins in the pond near Range 36. They were seen at Mudhen Lake from 26 Oct to 15 Dec 06, with a maximum of 4 seen on 13 Dec.

126. Golden-crowned Kinglet

Few winter records. There were 2 noted on the golf course on the 1998 CBC. Seen in Dec 01 until 10 Mar 02. Not seen again until 12 Dec 02.

127. Ruby-crowned Kinglet

Winter resident in trees. Last seen on 6 Apr 96, 12 Apr 02, and 6 Apr 03. Main fall arrival in early October, *e.g.* 3 Oct 02, 6 Oct 03. Usually fewer than 10 are seen, but in the fall of 2006 up to 30 could be seen at a single place. Usually 15–30 are seen on the CBCs.

128. Blue-gray Gnatcatcher*

Recorded from 30 Mar 96 and 10 Mar 02 through spring in oak-chaparral areas. Last records: 7 Jul 98, 19 Aug 99, 2 seen in chapparal on the 2001 CBC, and 20 Aug 02. Robert Horn saw 1 near Creekside on 1 Nov 03.

129. Western Bluebird*

Seen throughout the year, although recorded on a minority of the stops. The flocks usually have 5 or fewer individuals. Bluebirds may have become more common on Ft. Ord between 1996 and 2006.

130. Mountain Bluebird

7 seen on Camp Ord on 3 Jan 37. [See Don Roberson, *Monterey Birds,* 2nd Edition, 2002.]

131. Townsend's Solitaire

1 record: 1 seen and photographed by the BLM Office on 22 Oct 07.

132. Swainson's Thrush

First heard singing in dense willows along Crescent Bluff Road on 4 May 96. Heard singing on 8 and 16 Jun 96 near Guidotti Gate. Migrant heard singing on 14 May 02. In 2003 a May migrant. Noted 23 to 30 Apr 05. Just 1 or 2 seen per day.

133. Hermit Thrush

Widely spread fall records of 1 to 3 birds starting 18 Oct 01, 13 Oct 02, and 14 Oct 03. A winter resident; most have left by the end of February. Sporadic records up to 6 Apr (2003). A surprising 9 seen at once at the Huffman Tank on 23 Nov 02.On the 9 CBCs a high of 22 were counted on 28 Dec 99 and a low of 3 were noted on 27 Dec 96.

| | | |
|---|---|---|
| 134. | American Robin* | A few present in certain locations, e.g. Mudhen Lake, and the BLM compound. Seen throughout the year. On 15 Aug 98 there was a "fall" flock of ten by the BLM office. Only 1 record from 18 Sep through 18 Oct 01. After that, more frequently seen. In 2003 seen on 6 Jun, and not again until 7 Nov. On 3 Feb 04 there was a winter flock of 32 at the corner of Eucalyptus and Barloy Canyon Roads. An outstanding record was the 1190 counted on the 1994 CBC. |
| 135. | Varied Thrush | Seen by Don Roberson at Lower Pilarcitos Pond on 2 CBCs: 1 seen on 28 Dec 92 and 3 seen on 28 Dec 99. Also seen, 1 each, on 24 Nov and 25 Dec 06 at the BLM office area, and on 1 Dec 06 near Lower Pilarcitos Pond. The 24 Nov and 1 Dec birds were singing. |
| 136. | Wrentit* | Seen (heard) throughout the chaparral throughout the year. |
| 137. | Northern Mockingbird* | Small numbers usually seen near housing areas, but also seen around trees or shrubs in the grasslands. |
| 138. | Brown Thrasher | 1 seen near Mudhen Lake on 14 Oct 84. [See Don Roberson, *Monterey Birds,* 2nd Edition, 2002.] |
| 139. | California Thrasher* | Seen (heard) throughout the chaparral throughout the year, but with lower frequency than the Wrentit. |
| 140. | European Starling | Seen in many locations throughout the year. Common along El Toro Creek; however, infrequently seen at many places. In 2006 they were more common throughout Ft. Ord. |
| 141. | American Pipit | Winter visitor: 7 at Fox Pond on 14 Feb 01; 39 not far from the top of Oil Well Road on 17 Feb 01. In 2003 last seen on 21 Mar, and in 2004 on 12 Apr. |
| 142. | Cedar Waxwing | Winter resident. First fall record: 10 seen on 3 Oct 01. On 26 Feb 01 there were 44 by El Toro Creek. Late records: on 7 May 02 there were about 10 by El Toro Creek, and on 25 May 03 there were 32 in the same location; in 2004 there were 50 seen on 19 May and 7 seen on 4 Jun. In 2005 seen mainly in April. Seen just 3 times in 2006. |
| 143. | Phainopepla | 2 seen along Crescent Bluff Road on 12 Apr 02. Reported by Chuck Haugen in July 2002. Up to 3 seen visiting elderberries along El Toro Creek on 25 and 26 Jul 02. Next seen 28 and 29 Sep 06, when 2 visited an elderberry on the corner of Eucalyptus and Barloy Canyon Roads. Previously reported by Bruce Gerow as a non-breeding visitor during the Monterey Breeding Bird Atlas project. |
| 144. | Orange-crowned Warbler* | First annual records: 9 Mar 96, 1 Mar 01, 9 Mar 03, 15 Feb 04, 18 Feb 05. On 9 Mar 03, 16 were heard singing. Frequently recorded in chaparral/oaks from 14 Apr on. Infrequently recorded in July and August. In 2001 a noticeable fall migration in September and October, and 2 were seen on 1 Nov. In 2003 later individuals included 1 on 22 Oct and 1 on 4 Dec, both near water. They have been seen on approximately half of the CBCs. |
| 145. | Nashville Warbler | Migrant. 1st record: 1 at El Toro Creek on 17 Sep 01. Other records of 1 individual from 6 to 9 Oct 01, 11 Mar 03, and 21 Apr 03. |

| | | |
|---|---|---|
| 146. | Northern Parula | 1 sure record: 1 on 5 Oct 01 on 7th Street. Also, likely an immature female seen on Parker Flats Cutoff on 27 Oct 02. |
| 147. | Yellow Warbler | Spring records: 1 heard near Mudhen Lake on 21 Apr 96, and ones seen on 14 May and16 May 02, 17 Apr 03, and 17 and 25 Apr 04. In 2001 one to three were regularly seen from mid-September to mid-October. |
| 148. | Yellow-rumped Warbler | Winter resident. Peak on 6 Apr 96, and last seen on 20 Apr 96 and 12 Apr 02. First seen on 27 Sep 01, 1 Oct 02, and 26 Sep 06. Also, there was an isolated record of 1 on Ingman Ct. on 15 Aug 02. Nearly all are of the Audubon's race. I saw 1 bird of the Myrtle race on 2 Nov 01, and 2 on 19 Nov 03. On 9 CBCs a low of 27 were seen in 1989 and a high of 104 were seen in 1993. The 1993 CBC count included 12 of the Myrtle race. |
| 149. | Black-throated Gray Warbler | 4 spring records: 20 Apr, 28 Apr, 4 May 96, and 28 Apr 03. A female was seen on the golf course during the CBC on 29 Dec 98. |
| 150. | Townsend's Warbler | Winter resident. Earliest fall record 20 Sep 01. Seen through February in 2001. Six or fewer seen per field trip. Spring records: a female seen on 1 Jun 96 and 3 males on 23 Mar 02; in 2003 seen from 9 Mar until 8 May. On 9 CBCs fewer than 10 were noted on 4 years, and more than 10 on 5 years, with a maximum of 33 in1993. |
| 151. | Hermit Warbler | 3 records, all at the BLM office area: 1 on 5 May 03, 5 seen on 8 May 03, and 1 on 28 Apr 05. |
| 152. | Black-and-white Warbler | 1 record: 1 seen by Don Roberson on the 28 Dec 84 CBC. |
| 153. | MacGillivray's Warbler | In the spring of 1999 Bruce Gerow encountered a singing male in the chaparral on Crescent Bluff. |
| 154. | Common Yellowthroat* | Probably to be found all year at the corner of Barloy Canyon and Eucalyptus Roads and/or Mudhen Lake prior to the 2003 burn. In 2003 not seen in these areas following the July fire. In the dry year of 2004, just a few records from 21 Apr to 30 Jun. Mainly noted around Mudhen Lake in 2006. |
| 155. | Wilson's Warbler* | Summer resident some years along upper El Toro Creek. Earliest records: 7 Apr 96 and 27 Mar 04. Latest record: 2 Aug 97. A migratory flock of 10 at the BLM office on 8 May 03 was unusual. |
| 156. | Yellow-breasted Chat | 1 record: 1 heard singing in a tangle along Crescent Bluff Rd. on |
| 157. | Western Tanager | Spring migrants recorded on 4 May and 1 Jun 96, and from 1 to 8 May 03. In 2005 the early record was 24 Apr, and by 30 Apr a flock of 3 was seen. Two flocks noted in May 03, with a maximum of 10 at the BLM office on the 8th. Fall migrants on 25 Jul to 2 Aug 98, and until 20 Sep 01. A late bird was seen near Parker Flats Cut-off on 29 Oct 05. |
| 158. | [Green-tailed Towhee | 1 seen on 28 Feb 02 on Parker Flats Road near Eucalyptus Road. Efforts to find the bird later failed.] |

| | | |
|---|---|---|
| 159. | Spotted Towhee* | A permanent resident seen throughout the chaparral. In comparison with the California Towhee, this bird is more restricted in habitat and fewer are seen. |
| 160. | California Towhee* | Common throughout the year, and widely distributed. Seen on virtually all trips, although not in large flocks. On 9 CBCs a low of 18 were seen in 1989 and a high of 63 were noted in1993. |
| 161. | Rufous-crowned Sparrow* | In April of 2000 Sam Fitton found 2 singing by the big washout into Mudhen Lake. One was still there at least as late as 21 Jun 00. Seen along Barloy Canyon Road on 9 and 14 May 02, and from 13 Feb until 18 Mar in 2003. |
| 162. | Chipping Sparrow* | 1 record prior to 2004: 2 at the campground on Watkins Gate Rd. on 11 May 03. Regularly seen in the burn area in the spring of 2004, with nesting probable. Seen there again in 2005. |
| 163. | Lark Sparrow* | Seen all year, but infrequently in the winter. Most commonly seen in the grasslands, but also apparently breeding in or near the chaparral areas. Regularly seen at the BLM compound. |
| 164. | (Bell's) Sage Sparrow* | Resident. Thinly spread over the burned chaparral areas. I likely overlooked them before Bruce Gerow pointed out that they were there. My first record: 4 Jul 98. Birds with young fledgling seen on 3 Jul 06. Don Roberson noted between 1 and 4 individuals on the CBCs in11993, 1996, 1998, and 2000. |
| 165. | Savannah Sparrow | Winter resident in the grasslands. Approximately 60 seen high in the grasslands on 17 Dec 06. Last spring record: 28 Apr 96. First fall records: 26 Sep 01, and 22 Oct 02. |
| 166. | Grasshopper Sparrow* | Breeding bird of the grasslands. First seen on 14 Apr 96, on 27 Apr 02, on 21 Mar 03, on 9 Mar 04, and 16 Mar 05. Approximately 30 singing birds detected in 1996, 5 or 6 of these were on Machine Gun Flats. Bird in juvenal plumage seen on 16 Jun 96. Seen until the end of the inventory in 1996. There were 35 or more singing birds on Ft. Ord in Jun 00. There were likely as many in Jun 02, but likely fewer in 2003. |
| 167. | Fox Sparrow | Winter resident, but much more common in fall. First noted in chaparral on 5 Oct 01, 1 Oct 02, 30 Sep 03, and 29 Sep 05. Last seen on 25 Jan 02 and 14 Mar 03. Usually 1 or 2 seen, but 10 to 20 were at the Huffman Tank on 29 Oct 02. 84 were seen on the 28 Dec 84 CBC. All Fox Sparrows seen have been of the 'Sooty' race. |
| 168. | Song Sparrow* | There are 2 to 6 individuals at nearly every pond throughout the inventory. |
| 169. | Lincoln's Sparrow | Mostly a spring and fall migrant, but few recorded per year. The 2 that Sam Fitton and I saw at Fox Pond on 11 Aug 99 were unusually early. |
| 170. | White-throated Sparrow | 1 record: 1, perhaps immature, at Mudhen Lake 15 Oct 01. |
| 171. | Harris's Sparrow | One immature seen on Trail 22 on 16 Jan and 25 Jan 02. |

172. White-crowned Sparrow — Winter resident in backcountry Ft. Ord. Last seen on 29 Apr 05. Earliest fall record: 2 at Fox Pond on 13 Aug 99. In the fall of 2001 the main migration arrived by 26 Sep. I usually record fewer than 10, but I saw approximately 50 along El Toro Creek on 30 Nov 03.

173. Golden-crowned Sparrow — Common winter resident, October through April. Last seen on 21 Apr 96, and on 2 May 02. Seen in good numbers, around 20, by 5 Oct 01 (and 6 Oct 03). First noted in fall on 1 Oct 02 and 30 Sep 03.

174. Dark-eyed Junco* — Common breeding bird in oak woods and at the BLM compound. Seen throughout the year. In 2003 flocks of 50 were seen in October, but in other seasons 20 or fewer were seen.

175. Black-headed Grosbeak* — Summer resident near Guidotti Gate. Seen as early as 16 Apr 02 and 7 Apr 03, and as late as 1 Aug 99.

176. Lazuli Bunting* — 4 records prior to 2002: 28 Apr 96, 4 May 96, and 28 Jun 98, 1 Aug 99. The June record was of a singing male at Mudhen Lake. Strong migration in 2002, seen from 23 Apr to 25 May, with a peak of around 15 seen on 7 May. Weak migration in 2003, seen from 1 May until 6 Jun. A strong migration again in 2004; noted 19 Apr to 30 Jun, with around 30 individuals in the burn area alone. Probable breeding in the burn area followed the migration. In 2006 they probably bred in the 2005 burn area off Parker Flats Road.

177. Red-winged Blackbird* — Concentrated near ponds and also seen elsewhere throughout the year, although scarce in August, except, possibly, at the roost at the pond on Watkins Gate Road near West Camp Street.

178. Tricolored Blackbird* — The known colony on Oil Well Road has been active most years. The colony has maintained over 50 birds. On 26 Jul 98 I watched them come to feed at the play fields of El Toro Creek community. Ten or more visit the Equestrian Center in winter. They were seen there up to 28 Feb 02. 120 were counted on the 27 Dec 89 CBC, and 200 on the 28 Dec 93 CBC.

179. Western Meadowlark* — Small numbers on grassland and Machine Gun Flats in the spring and summer. Larger, more widespread groups of up to 50 seen in the fall and winter. Usually seen in double digits on the CBCs; a low of 8 was seen on the 29 Dec 01 count, and a high of 323 on 28 Dec 93.

180. Brewer's Blackbird* — Present throughout the inventory. Especially common at the BLM compound, prior to the fall of 2001. Common in residential areas. 850 were noted on the 27 Dec 89 CBC.

181. Brown-headed Cowbird — 5 records: 22 Mar 96, 30 May 02, 23 May 03, 29 Apr and 30 Apr 05.

182. Hooded Oriole* — Added to inventory on 11 Jul 98. Sam Fitton pointed out that they were near El Toro Creek. I found at least 3 pairs breeding in Fan Palms in El Toro community, and using Ft. Ord to feed. They continue to be seen only in this area.

| | | |
|---|---|---|
| 183. | Bullock's Oriole* | Summer resident. Earliest records: 20 Apr 02 and 2 Apr 03. Breeding along El Toro Creek, and possibly other riparian areas with tall (Eucalyptus) trees. Not seen after mid-August. Bruce Gerow noted especially large numbers of both oriole species nesting in the El Toro Creek area in 2001. |
| 184. | Purple Finch* | Present in the oaks and at the BLM compound throughout the inventory. Usually no more than 5, but sometimes 10 or 20 are in a flock. |
| 185. | House Finch* | Seen in small numbers throughout Ft. Ord throughout the inventory. Seen at the BLM compound in larger numbers. Abundant in the housing areas of Ft. Ord. |
| 186. | Pine Siskin* | At BLM compound from first inventory until 2001. However, not encountered in the fall (inventory in 2001). Seen Jan 02 through 23 Apr 02, and then gone: perhaps sensitive to drought. In the drought year of 2003 seen only from 23 Jan to 28 Apr. No Siskins noted in the dry year of 2004, and a few were noted in 2005 or 2006. |
| 187. | Lesser Goldfinch* | Seen throughout the inventory wherever there are trees. Uncommon in the backcountry in the dry season of 2002. Hardly seen after Jul 03, another dry season, and in2006 not noted after 7 Dec. |
| 188. | Lawrence's Goldfinch* | Seen at the BLM compound and in riparian locations in the chaparral. First seen on 24 Mar 96. Not seen at all in 1998. In 2000 last seen on 15 Jun. The 2002 records span 14 Apr to 20 Aug. In 2003 just 2 records of 2 each on 23 May and 16 Jun. The year 2004 was a strong one with records regularly from 19 Apr to 10 Sep, especially in the burn area where they probably bred. Two fall records: 2 near El Toro Creek on 27 Oct 01, and 1 at recent burn on 19 Oct 06. |
| 189. | American Goldfinch | Fall and winter resident. 1st record: approximately 50 near El Toro Creek on 9 Feb 01. Smaller numbers seen in fall starting 24 Oct 01, 22 Oct 03, and 1 Nov 05. Usually the first fall records are in October. |
| 190. | House Sparrow* | Common in the housing areas on Ft. Ord. Barely seen in Backcountry Ft. Ord. |

# 1 Introduction

## 1.1. Summary

The Proposed Pure Water Monterey Groundwater Replenishment Project (GWR Project) components, including the proposed water treatment plant, diversion and transmission pipelines, injection well locations, and potential staging areas, were evaluated to identify areas potentially supporting coastal wetlands, federal wetlands, and other waters. Six locations within the project area were identified as being within or adjacent to potentially jurisdictional wetlands: Reclamation Ditch Diversion site, Tembladero Slough Diversion site, Blanco Drain Diversion site, Locke Paddon Lake, Roberts Lake, and Lake El Estero Diversion site. In addition to the potential for direct impacts of the six locations, reaches downstream of the Reclamation Ditch and Tembladero Diversion sites were evaluated because the operation of the project has the potential to indirectly impact wetlands as a result of the proposed water diversion. This area is referred to as the "Ditch" throughout this report.

This wetland delineation was conducted in accordance with *The Field Guide for Wetland Delineation: 1987 Corps of Engineers Manual* (Wetland Training Institute, 2002) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (U.S. Army Corps of Engineers [ACOE], 2008) to identify the present of wetlands and other waters potentially under the jurisdiction of the ACOE and the California Coastal Commission (CCC). Wetlands and/or other waters were identified within five of the six locations and within the Ditch. Wetlands and other waters were not identified within the Lake El Estero Diversion site; however, wetlands and other waters observed within the adjacent Lake El Estero are identified within this report for reference. The following table summarizes the area of wetlands and other waters identified within the evaluation areas.

**Table 1-1: Wetlands and Other Waters in the Evaluation Area**

| **Evaluation Area** | *Potential Federal Wetland* | *Potential Coastal Wetland* | *Potential Other Waters of the U.S.* |
|---|---|---|---|
| *Reclamation Ditch Diversion* | 0 ac. | 0 ac. | 0.05 ac. |
| *Tembladero Slough Diversion* | 0 ac. | 0.01 ac. | 0.20 ac. |
| *Blanco Drain Diversion* | 0 ac. | 0 ac. | 0.30 ac. |
| *Locke Paddon Lake* | 0.26 ac. | 0.57 ac. | 0 ac. |
| *Roberts Lake* | 0.55 ac. | 0.57 ac. | 0.25 ac. |
| *Lake El Estero Diversion* | 0 ac. | 0 ac. | 0 ac. |
| *Ditch* | 14.48 ac. | 18.37 ac. | 51.15 ac. |

## 1.2. Project Description

This wetland delineation report was prepared for the GWR Project, located in Monterey County, California (**Figure 1**). The purpose of the GWR Project is to create a reliable source of water supply by taking highly-treated water from a new advanced water treatment plant, and injecting it into the Seaside Groundwater Basin (or Seaside Basin) using a series of shallow and deep injection wells. Once injected into the Seaside Basin, the treated water would mix with the existing groundwater in the aquifers and be stored for future use. Providing high quality replacement water to the Seaside Basin will allow California American Water Company (CalAm) to extract the same amount of water for delivery as it currently does to its customers in the Monterey District service area, while ceasing over-pumping of the Carmel River, as ordered by the state.

Figure

1

The entire GWR Project, including the proposed water treatment plant, diversion and transmission pipelines, injection well locations, and potential staging areas, was evaluated to identify areas potentially supporting state or federal jurisdictional wetlands and other waters. Six locations within the project area were identified as being within or adjacent to potentially jurisdictional wetlands: Reclamation Ditch Diversion site, Tembladero Slough Diversion site, Blanco Drain Diversion site, Locke Paddon Lake, Roberts Lake, and Lake El Estero Diversion site (**Figure 1**). All four diversion sites are existing outfalls that will require the development of additional physical infrastructure. No diversion is proposed from Lock Paddon or Roberts Lake; however, they are included in this delineation because new transmission line alignments are proposed adjacent to them.

In addition to the potential for direct impacts of the six locations identified above, reaches downstream of the Reclamation Ditch and Tembladero Diversion sites were evaluated because the operation of the project has the potential to indirectly impact wetlands as a result of the proposed water diversion. For this evaluation, "Ditch" refers to the channel alignment downstream of the Reclamation Ditch Diversion to the tide gates at Potrero Road in Moss Landing, California, and includes portions of the Reclamation Ditch, Tembladero Slough, and the Old Salinas River Channel. Additionally, "Ditch" includes the Old Salinas River Channel upstream of the confluence with the Tembladero Slough to the slide gate on the Salinas Lagoon. The evaluation area does not include areas downstream of the tide gates as the proposed diversions would not appreciably change the hydrology or hydrologic regime beyond the gates, and would not result in impacts to wetlands beyond the tide gates. A delineation was not performed on the Salinas River downstream of the proposed Blanco Drain Diversion, as it was determined that the small amount of water proposed for diversion was negligible in the context of the existing flow and would have a less than significant impact on the wetlands or other waters below the diversion. This report also identifies wetlands and other waters present within Lake El Estero, adjacent to the Lake El Estero Diversion site; however, no impacts to this resource are expected as a result of the project. The City of Monterey actively manages the water level in Lake El Estero so that there is storage capacity for large storm events. Prior to a storm event, the lake level is lowered by pumping or gravity flow for discharge to Del Monte Beach. The Proposed Project would include improvements that would enable water that would otherwise be discharged to the beach to instead be conveyed to the Regional Treatment Plant to be recycled.

## 1.3. Regulatory Background

### 1.3.1. Federal Regulation

The U.S. Army Corps of Engineers (ACOE) is the primary federal agency responsible for regulating wetlands and waters of the United States (waters).

#### *1.3.1.1. Wetlands*

ACOE provides technical guidelines on wetland delineation in *The Field Guide for Wetland Delineation: 1987 Corps of Engineers Manual* (Wetland Manual) (Wetland Training Institute, 2002). The Wetland Manual defines wetlands and the three environmental diagnostics (or parameters) as:

a. *Definition.* The ACOE (ACOE 1982) and the EPA (EPA 1980) jointly define wetlands as: Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

b. *Diagnostic environmental characteristics.* Wetlands have the following general diagnostic environmental characteristics:

(1) *Vegetation.* The prevalent vegetation consists of macrophytes that are typically adapted to areas having hydrologic and soil conditions described in *a* above. Hydrophytic species, due to morphological, physiological, and/or reproductive adaptation(s), have the ability to grow, effectively compete, reproduce, and/or persist in anaerobic soil conditions.

(2) *Soil.* Soils are present and have been classified as hydric, or they possess characteristics that are associated with reducing soil conditions.

(3) *Hydrology.* The area is inundated either permanently or periodically at mean water depths ≤ 6.6 ft, or the soil is saturated to the surface at some time during the growing season of the prevalent vegetation, the average annual duration of inundation or soil saturation does not preclude the occurrence of plant species typically adapted for life in aerobic soil conditions.

For an area to be considered a wetland under ACOE guidelines, all three parameters (vegetation, soils, or hydrology, as defined by the ACOE) must be met. However, climatic and hydrologic conditions in the Arid West often make it difficult to identify wetland indicators. The 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Supplement) (ACOE, 2008) provides indicators for each parameter that are specific to the Arid West region and is used in conjunction with the Wetland Manual.

*1.3.1.2. Waters of the U.S.*

Waters are defined as:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. All "other waters" such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
   i. Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
   ii. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
   iii. Which are used or could be used for industrial purpose by industries in interstate commerce;
4. All impoundments of waters otherwise defined as waters of the United States under the definition;
5. Tributaries of waters identified in paragraphs [1-4] of this section;
6. The territorial seas;
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs [1-6] of this section (ACOE, 1982).

As noted above, "other waters," including lakes, ponds, and streams, are subject to ACOE jurisdiction. "Other waters" are characterized by an ordinary high water (OHW) mark, which is defined as:

> "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the characteristics of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (ACOE, 1982).

In the field, "other waters" are identified by the presence of a defined river or stream bed, a bank, and evidence of the flow of water.

#### *1.3.1.3. U.S. Army Corps of Engineers Jurisdiction*

On June 5, 2007, the ACOE and the EPA developed a Memorandum Regarding *Clean Water Act Jurisdiction Following Rapanos v. United States* which states that the agencies will assert jurisdiction over the following categories of water bodies:

- TNWs [traditional navigable waters] and wetlands adjacent to TNWs and
- Non-navigable tributaries of TNWs that are relatively permanent (i.e., the tributaries typically flow year-round or have continuous flow at least seasonally) and wetlands that directly abut such tributaries

> In addition, the following waters will also be found jurisdictional based on a fact-specific analysis that they have a significant nexus with a TNW:
>
> - Non-navigable tributaries that do not typically flow year-round or have continuous flow at least seasonally;
> - Wetlands adjacent to such tributaries; and
> - Wetlands adjacent to but that do not directly abut a relatively permanent non-navigable tributary
>
> A significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or an insubstantial effect on the chemical, physical, and/or biological integrity of a TNW. Principal considerations when evaluating significant nexus include the volume, duration, and frequency of the flow of water in the tributary and the proximity of the tributary to a TNW, plus the hydrologic, ecologic, and other functions performed by the tributary and all of its adjacent wetlands" (ACOE & EPA, 2007).

The term "navigable waters of the U.S." is defined to include:

> "all those waters that are subject to the ebb and flow of the tide, and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce" (ACOE, 1982).

### 1.3.2. State Regulation

Although wetlands are typically under the jurisdiction of the ACOE, wetlands occurring within the coastal zone are regulated by the California Coastal Commission (CCC) under the California Coastal Act (CCA) of 1976 and the federal Coastal Zone Management Act (CZMA).

#### *1.3.2.1. Coastal Wetlands*

Section 30121 of the CCA broadly defines a wetland as:

> "…lands within the coastal zone which may be covered periodically or permanently with shallow water and include saltwater marshes, freshwater marshes, open or closed brackish water marshes, swamps, mudflats, or fens."

The California Code of Regulations Section 13577 (b)(1) of Title 14, Division 5.5, Article18, provides an expanded definition:

> "…Wetlands are lands where the water table is at, near, or above the land surface long enough to promote the formation of hydric soils or to support the growth of hydrophytes, and shall also include those types of wetlands where vegetation is lacking and soil is poorly developed or absent as a result of frequent or drastic fluctuations of surface water levels, wave action, water flow, turbidity or high concentrations of salt or other substance in the substrate. Such wetlands can be recognized by the presence of surface water or saturated substrate at some time during each year and their location within, or adjacent to, vegetated wetlands or deepwater habitats. …"

The Federal procedures to identify indicators and evaluate whether a site meets any of the three parameters is typically used to delineate coastal wetlands. For this delineation, data was collected and procedures followed in conformance with the ACOE's Wetland Manual and the Supplement. The presence of one or more parameters (vegetation, soils, or hydrology, as defined by the ACOE) was used to delineate a wetland under CCC jurisdiction.

# 2. Methods

This wetland delineation was conducted in accordance with the requirements set forth in the Wetland Manual and Supplement, as appropriate, to identify indicators and evaluate whether a site meets any or all of the three parameters. Prior to conducting field surveys, available reference materials were reviewed, including the National Wetlands Inventory Wetland Mapper (Service, 2014), the Web Soil Survey for Monterey County (USDA, 1978), the list of Hydric Soils of the United States (USDA NRCS, 2014), the Soil Survey Geographic Database (USDA-NRCS, 2003), the Source Water Alternative Site Locations Maps prepared by DD&A in December, 2013, the Area of Potential Effect (APE) Maps prepared by DD&A in April 2014, and aerial photographs of the site.

In addition, the following existing report was evaluated in preparation of this wetland delineation report[1]:

- Monterey Bay Regional Desalination Project Administrative Draft Delineation of Jurisdictional Wetlands and Waters under Section 404 of the Clean Water Act and California Coastal Act (DD&A 2011)

## 2.1. Field Methods

In July 2014, August 2014, and February 2015, DD&A biologists Matthew Johnson, Jami Davis, and Shaelyn Hession, conducted field surveys to confirm and update existing data from overlapping projects (identified above) and collect new data within areas of the evaluation area not previously evaluated. All data collected previously and not specific to this delineation was field checked to ensure site conditions had not changed. Field survey data were recorded on Wetland Determination Data Forms for the Arid West Region provided in the Supplement (Appendix A). Seventy-three (73) sampling points were taken within the evaluation areas. Each sampling point was mapped using a Trimble Pro XH GPS unit and a picture was taken of the area immediately surrounding the point. All points were subsequently displayed in GIS using ArcGIS software. Data collected at each sampling point was analyzed to determine if wetlands and/or waters were present. Vegetation, soils, and hydrology were assessed following the guidelines detailed in the Wetland Manual and Supplement. For an area to be considered a wetland under ACOE guidelines, all three parameters must be met.

For the El Estero Diversion site, data was collected only within the evaluation area, where direct impacts would occur. As noted above, the GWR Project would include improvements that would enable water that would otherwise be discharged to the beach to instead be conveyed to the Regional Treatment Plant to be recycled, and, therefore, will not result in indirect impacts to these resources as a result of water diversion. However, the location of wetlands and other waters within the adjacent Lake El Estero were mapped to show the location of these resources in relation to the GWR Project site. These resources were mapped using only aerial images, Google street view (Google, 2014), and personal knowledge of the resources.

### 2.1.1. Vegetation

Vegetation was categorized into four strata: tree, sapling/shrub, herb, and woody vines. Areas around sampling points were evaluated and vegetation plot sizes were selected to adequately describe the sample area. Dominant plant species, and their approximate percent cover within five to ten feet of the sampling point were recorded for sapling/shrub, herb, and woody vine layers, and within 10 feet for the tree layer.

[1] Existing data previously collected within the evaluation area were field checked and used for this report.

Plant species were identified using An Illustrated Field Key to the Flowering Plants of Monterey County (Matthews, 2006) and The Jepson Manual: Vascular Plants of California, Second Edition (Baldwin, et al., 2012), and were assigned a wetland status according to the *Arid West 2014 Regional Wetland Plant List* (Lichvar, et al., 2014). The wetland plant classification system is based on the expected frequency of occurrence in wetlands as described in Table 2-1.

**Table 2-1: Wetland Vegetation Classification System**

| Symbol | Indicator Category | Definition | Frequency of Occurrences |
|---|---|---|---|
| **OBL** | Obligate Wetland Plants | Always found in wetlands | >99% |
| **FACW** | Facultative Wetland Plants | Most often occur in wetlands | 67-99% |
| **FAC** | Facultative Plants | Equal likelihood of occurring in wetlands and non-wetlands | 33-67% |
| **FACU** | Facultative Upland Plants | Most often occur in non-wetlands | 1-33% |
| **UPL** | Obligate Upland Plants | Always found in non-wetlands | <1% |
| **NL** | Not Listed (Assumed Upland) | | |

The "dominance test", as described in the Supplement, was applied for each survey point. If more than 50 percent of the dominant plant species across all strata were in the indicator categories of OBL, FACW, or FAC, then the vegetation was considered hydrophytic. The other indicators of hydrophytic vegetation described by the Supplement (Prevalence Index and Morphological Adaptations) were not used.

### 2.1.2. Soils

The National Technical Committee for Hydric Soils (NTCHS) defines a hydric soil as:

> "A soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (USDA-NRCS, 1995).

The soil at each survey point was evaluated by digging an 18-inch hole, when possible, and identifying soil horizons, color, and texture, as well as any hydric soil indicators (as described in the Supplement). Soil color was evaluated by comparing a small wetted piece of soil to Munsell Soil Color Charts (Munsell, 2000). The ending value of the Munsell Soil Notation refers to the chroma of the sample. Measures of chroma consist of numbers beginning with 0 for neutral grays and increasing at equal intervals to a maximum of about 20.

### 2.1.3. Hydrology

The Wetland Manual defines "wetland hydrology" as:

> "Encompassing all hydrologic characteristics of areas that are periodically inundated or have soils saturated to the surface at some time during the growing season. Areas with evident characteristics of wetland hydrology are those where the presence of water has an overriding influence on characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively. Such characteristics are usually present in areas that are inundated or have soils that are saturated to the surface for sufficient duration to

> develop hydric soils and support vegetation typically adapted for life in periodically anaerobic soil conditions."

Each survey point was evaluated for wetland hydrology using the indicators described in the Supplement. Evidence of one Primary Indicator sufficiently identified wetland hydrology. Two or more Secondary Indicators were necessary to identify wetland hydrology if no Primary Indicators were observed.

In the Arid West, the lack of a hydrologic indicator does not always signify the absence of wetland hydrology. As stated in the Supplement, the Arid West is characterized by extended dry seasons in most years and by extreme temporal and special variability in rainfall, causing many wetlands in the region to be dry for much of the year. During the extended dry season, hydrology indicators may be lacking altogether at a difficult or problematic site. Guidance is provided in the Supplement for difficult wetland situations such as this.

*This Page Left Intentionally Blank*

# 3. Description of Evaluation Areas

The GWR Project was evaluated for the presence of potentially coastal wetlands, federal jurisdictional wetlands, and other waters of the U.S. Six locations were identified as potentially being directly impacted:

- Reclamation Ditch Diversion
- Tembladero Slough Diversion
- Blanco Drain Diversion
- Locke Paddon Lake
- Roberts Lake
- Lake El Estero Diversion

In addition, reaches downstream of the Reclamation Ditch and Tembladero Diversion sites were also evaluated, as wetlands in these reaches have the potential to be indirectly impacted as a result of the water diversion during operation of the GWR Project. Reaches downstream of the Blanco Drain Diversion within the Salinas River were not evaluated, as the amount of water proposed for diversion is too small to have significant impacts to any downstream wetlands. For this evaluation, "Ditch" refers to the channel alignment downstream of the Reclamation Ditch Diversion to the tide gates at Potrero Road in Moss Landing, California and the Old Salinas River Channel upstream of the confluence with Tembladero Slough, to the slide gate on the Salinas River Lagoon. The Ditch includes portions of the Reclamation Ditch and Tembladero Slough, as well as the entire Old Salinas River Channel. The Ditch was identified as having the potential to be indirectly impacted.

No formal delineation was conducted at Lake El Estero outside of the proposed diversion structure site as the proposed project is not anticipated to have direct or indirect impacts on the water level in Lake El Estero. Similarly, no formal delineation was conducted in the riparian area along the Salinas River within the Salinas Treatment Facility project study area as there are no anticipated direct impacts to this area and indirect impact are expected to be less than significant as a result of the proposed project.

## 3.1. Reclamation Ditch Diversion

The Reclamation Ditch Diversion evaluation area is located along the Reclamation Ditch adjacent to Davis Road, near the City of Salinas (**Figure 1**). This evaluation area is surrounded by development and the area is highly disturbed and maintained. Within this evaluation area, one sampling point was taken. The evaluation area is not located within the coastal zone.

### 3.1.1. Vegetation

The vegetation within the evaluation area is highly disturbed. Approximately half of the area is denuded and the other half is covered by thatch. The species composition of the thatch was not identifiable at the time of the survey; however, due to the disturbed nature of the site, it is likely that non-native species dominate.

### 3.1.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies two map units within the Reclamation Ditch Diversion evaluation area (**Figure 2**). The SSURGO Database description of these units is provided below with an indication of whether the soil is classified as hydric or not on the USDA NRCS *Hydric Soils of the United States* list (2014).

*This Page Left Intentionally Blank*

Figure 2

*This Page Left Intentionally Blank*

*Alviso Silty Clay Loam (Drained).* This poorly drained soil is found in basins and on tidal flats, and was formed in alluvium derived from sedimentary rocks. In a representative profile, the surface layer is a gray, neutral silty clay loam approximately five inches thick. Below that, there is approximately nine inches of light gray, mildly alkaline silty clay loam which is underlain by approximately 31 inches of light gray to gray mildly alkaline silty clay. In areas where this soil is classified as "drained" the soil has been partially drained by structures such as levees, dikes, and gates used to control the inflow of tidewater. This soil is classified as a hydric soil for Monterey County.

*Clear Lake Clay.* This poorly-drained soil is found on flood plains and in basins, and was formed in alluvium derived from sedimentary rocks. In a representative profile, the top layer is an approximately 24-inch thick, dark gray, moderately alkaline clay. This soil is classified as hydric for Monterey County.

### 3.1.3. Hydrology

The Reclamation Ditch bisects the evaluation area. A detailed description of the hydrology associated with Reclamation Ditch is presented in Section 3.6.3.

## 3.2. Tembladero Slough Diversion

The Tembladero Slough Diversion evaluation area is located along the Tembladero Slough at Watsonville Road, west of Highway 1 near the City of Castroville (**Figure 1**). This evaluation area is surrounded by agriculture and the area is highly disturbed and maintained. Within this evaluation area, two sampling points were taken. The evaluation area is located within the coastal zone.

### 3.2.1. Vegetation

The vegetation within the evaluation area is highly disturbed. Approximately half of the area is denuded and the other half is covered by thatch. The species composition of the thatch was not identifiable at the time of the survey; however, due to the disturbed nature of the site, it is likely that non-native species dominate.

### 3.2.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies two map units within the Tembladero Slough Diversion evaluation area (**Figure 2**). The SSURGO Database description of these units is provided below with an indication of whether the soil is classified as hydric or not on the USDA NRCS *Hydric Soils of the United States* list (2014).

*Clear Lake Clay (Moderately Wet).* Please see soil description provided in Section 3.1.2 for Reclamation Ditch Diversion soils. In areas where this soil is identified as "moderately wet" the soil is presently partly drained, but it was poorly drained when it formed. This soil is classified as hydric for Monterey County.

*Cropley Silty Clay, 0-2% Slopes.* These well-drained soils are found on alluvial fans, floodplains, basins, terraces, and terrace breaks, and were formed in alluvium derived from sedimentary rocks. In a representative profile, the surface layer is an approximately 36-inch thick, very dark gray, moderately alkaline silty clay. This soil is classified as hydric for Monterey County.

### 3.2.3. Hydrology

The Tembladero Slough bisects the evaluation area. A detailed description of the hydrology associated with Tembladero Slough is presented in Section 3.6.3. Additionally, a small drainage ditch is present within the evaluation area that drains water from adjacent agricultural fields into the Tembladero Slough.

## 3.3. Blanco Drain Diversion

The Blanco Drain system, commonly referred to as Blanco Drain, drains the surrounding agriculture surface run-off and tile drainage. The adjacent agricultural lands are used for growing table crops (e.g., leafy greens, berries, and artichokes). Agricultural practices, including the use of herbicides and pesticides, as well as fertilization, have contributed to the degraded hydrology associated with Blanco Drain. Following the installation of the Salinas River Diversion Facility (SRDF), approximately 1,000 feet downstream from Blanco Drain, culverts and flap gates were installed to prevent the Salinas River from back-filling Blanco Drain. The installation of the culverts and flap gates also prevented fish passage in Blanco Drain. The Blanco Drain Diversion evaluation area is approximately 3.7 acres, consisting of a 176 foot-long agricultural drainage ditch and approximately 52 linear feet of the Salinas River main channel and associated riparian habitat (**Figure 1**). Within this evaluation area, four sampling points were taken. Sampling points were taken in the drainage ditch, in sections of the Salinas River riparian corridor, and within a segment of degraded, historic riparian habitat located within the historic floodplain on the southern side of the Salinas River. An additional point (point 14) was taken near the evaluation area; however, after importing the GIS data, it was determined that this point is located outside of the evaluation area. This evaluation area is not located within the coastal zone.

### 3.3.1. Vegetation

The bank of the drainage ditch adjacent to agricultural fields is unvegetated. In the riparian corridor, vegetation cover includes a tree stratum dominated by arroyo willow, as well as herb stratum dominated by species including white sweetclover (*Melilotus albus*), rabbitfoot grass (*Polypogon monspeliensis*), and telegraph weed (*Heterotheca grandflora*). The vegetation in the degraded historic riparian habitat located on the historic floodplain on the southern side of the Salinas River and is significantly disturbed and dominated by a dead stand of poison hemlock (*Conium maculatum*).

### 3.3.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies three map units within the Blanco Drain Diversion evaluation area (**Figure 2**). The SSURGO Database description of these units is provided below with an indication of whether the soil is classified as hydric or not on the USDA NRCS *Hydric Soils of the United States* list (2014).

*Salinas Clay Loam, 0-2% Slopes.* This well-drained soil is found on low terraces and was formed in mixed alluvium derived from sedimentary and granitic rocks. In a representative profile, the surface layer is clay loam, silty clay loam, heavy loam, or heavy silt loam, approximately 33 inches thick, very dark gray, and dark gray. This soil type is classified as hydric for Monterey County.

*Mocho Silt Loam, 0-2% Slopes.* This well-drained soil is found on floodplains and was formed in alluvium derived mostly from sedimentary rocks. In a representative profile, the surface is layer an approximately 12-inch thick, grayish brown, calcareous silt loam. The subsoil is a light brownish gray, calcareous silty clay loam and silt loam, which extends to a depth of 68 inches or more. This soil is classified as hydric for Monterey County.

*Metz Complex.* This somewhat excessively drained soil is found largely along drainage ways and on modified sand dunes, and was formed in alluvium derived mostly from sedimentary rocks. The texture of the surface layer is variable, as this complex consists of undulating to gently rolling soils that are intermingled. In a representative profile, the surface layer is approximately 12 inches thick. The texture of the surface layer can include sand, loamy sand, silt loam, and sandy loam that is gravelly or cobbly in areas. The subsoil material extends to a depth of more than 60 inches; it is light brownish gray, moderately alkaline, stratified fine sand, sand, and very sandy loam. This soil is not classified as hydric for Monterey County.

### 3.3.3. Hydrology

In 2009-2010, the MCWRA SRDF was constructed downstream of the Blanco Drain. The SRDF includes an inflatable rubber dam that impounds water during the summer months to supply the diversion pump station. To overcome the backwater into the Blanco Drain channel, the channel was re-graded and a pump station was installed at the lower end. The pump station lifts Blanco Drain flows past a slide gate and into the gravity portion of the channel. The Blanco Drain watershed is approximately 6,000 acres and collects surface runoff and agricultural tile-drain flows from the surrounding area. The Blanco Drain is tributary to the Salinas River.

In this evaluation area, hydrology is confined to a stretch of agricultural drainage ditch approximately 176 feet long with a width ranging from 23 to 30 feet, and a section of the main channel of the Salinas River approximately 50 feet long and 150 feet wide.

## 3.4. Locke Paddon Lake

The GWR Project alignment runs along the eastern border of Locke Paddon Lake, which is located within the City of Marina near the intersection of Del Monte Boulevard and Reservation Road (**Figure 1**). Eight sampling points were taken within the Locke Paddon Lake evaluation area. This evaluation area is located within the coastal zone.

### 3.4.1. Vegetation

Vegetation at the top of the slope, immediately adjacent to the railroad tracks, is maintained and highly disturbed. Dominant vegetation consists of non-native annual grasses, such as slender oat (*Avena barbata*), and iceplant (*Carpobrotus edulis*). The slope down to the lake is dominated by California blackberry (*Rubus ursinus*) and stinging nettle (*Urtica dioica*). As the topography flattens out, cattail (*Typha latifolia*) and Arroyo willow dominate the vegetation overall, although in some areas, California blackberry and common rush (*Juncus effusus*) are also dominants.

### 3.4.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies one map unit within the Locke Paddon Lake evaluation area at Marina Greens Drive (**Figure 3**). The SSURGO Database description of this mapping unit is presented below with an indication of whether the soil is classified as hydric or not on the USDA NRCS *Hydric Soils of the United States* list (2014).

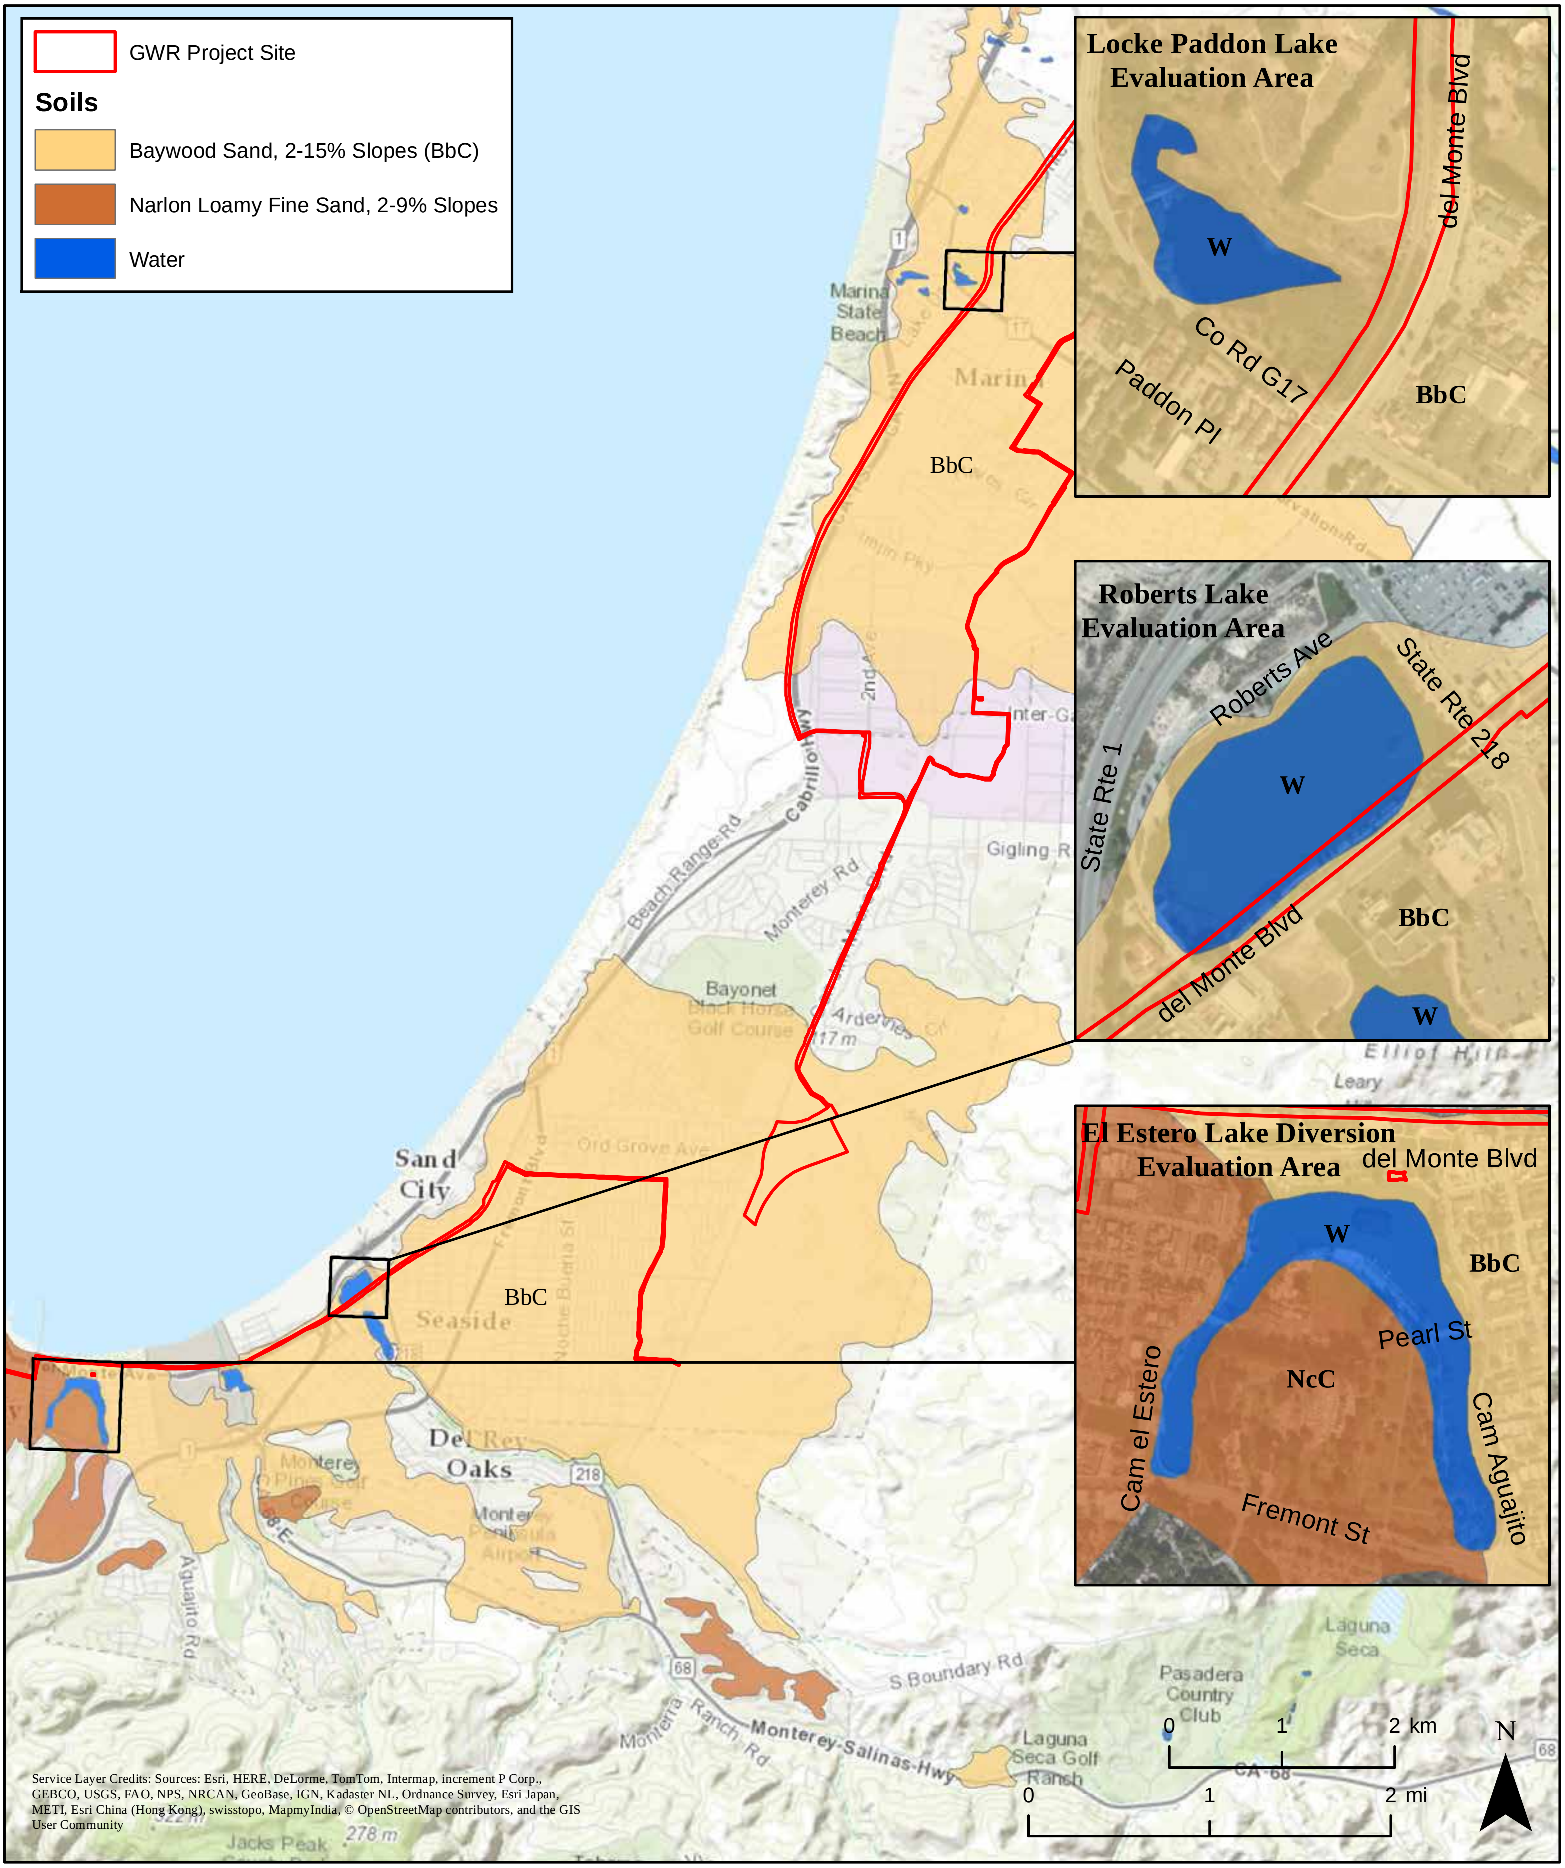
*Baywood Sand, 2-15% Slopes.* This somewhat excessively drained soil was formed in stabilized sand dunes. In a representative profile of this soil, the surface layer is approximately 21 inches thick, grayish brown and brown, slightly acidic and medium acid sand. Baywood sand is not classified as a hydric soil.

### 3.4.3. Hydrology

Lock Paddon Lake is a large vernal pond which is fed primarily by rainfall runoff. The lake is located within the Monterey Peninsula watershed.

## 3.5. Roberts Lake

The GWR Project alignment runs along the south-eastern border of Roberts Lake, which is located within the City of Seaside near the intersection of Del Monte Boulevard and Canyon Del Rey Boulevard (**Figure 1**). Within the Roberts Lake evaluation area, 10 sampling points were taken. This area is within the coastal zone.



# Locke Paddon Lake, Roberts Lake and El Estero Lake Evaluation Areas Soil Map

(831) 373-4341

Figure 3

### 3.5.1. Vegetation

Vegetation immediately adjacent to the railroad tracks is highly disturbed and maintained by mowing and several areas are completely devoid of vegetation. Dominant species within this area were ruderal, non-native species, including cheeseweed (*Malva parviflora*), ripgut brome (*Bromus diandrus*), fescue grass (*Vulpia* sp.), and black mustard. Closer to the water, dominant species included Arroyo willow, California blackberry, Indian melilot (*Melilotus indicus*), rabbitfoot grass, spearscale (*Atriplex triangularis*), and hardstem bulrush (*Schoenoplectus acutus*).

### 3.5.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies one map unit within this evaluation area (**Figure 3**).

*Baywood Sand 2-15% Slopes.* Please refer to the description of this soil type in Section 3.3.2 for Locke Paddon Lake soils.

### 3.5.3. Hydrology

Roberts Lake is a perennial lagoon in which the outflow into the Monterey Bay is regulated by a water level control structure that maintains a fairly constant surface water elevation (Monterey Peninsula Water Management District, 2005). The lagoon is the terminus of a system that drains the Highway 68 corridor from Laguna Seca west to Canyon Del Rey Boulevard and portions of the City of Seaside. Several ephemeral drainages connect with a drainage channel that nearly parallels Highway 68 and Canyon Del Rey Boulevard before emptying into Laguna Del Rey Lake, which is connected directly with Roberts Lake under Del Monte Boulevard. The lake is located within the Monterey Peninsula watershed.

## 3.6. Lake El Estero Diversion

The Lake El Estero Diversion evaluation area is located at the northwest corner of El Estero Park near Del Monte Blvd in the City of Monterey. El Estero Park is a 45-acre multi-use recreation area, which includes walking trails, BBQ picnic areas, paddleboat rentals, an exercise course, restrooms, the Dennis the Menace Playground, a dog park, a skate park, and a ball park. The evaluation area is located within the cement pad of an existing pump station. Lake El Estero is located immediately adjacent to the evaluation area. Within the Lake El Estero Diversion evaluation area, one sampling point was taken. Additional points were not taken surrounding the lake as the project will not result in any direct impacts or indirect impacts from water diversion; however in order to show the location of resources at the lake, mapping was conducted using aerial images, Google street view images (Google, 2014), and personal knowledge of the area. This evaluation area is not located within the coastal zone.

### 3.6.1. Vegetation

The Lake El Estero Diversion evaluation area is completely devoid of vegetation and is located entirely within an existing cement pad. The surrounding area within El Estero Park is dominated by maintained turf and landscaping. Small areas of emergent bulrush (*Schoenoplectus* sp.) are present along the edge of the lake in some areas; however, these areas are not adjacent to the evaluation area.

### 3.6.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies one map unit within this evaluation area (**Figure 3**).

*Baywood Sand 2-15% Slopes.* Please refer to the description of this soil type in Section 3.3.2 for Locke Paddon Lake soils.

Although not present within the Lake El Estero Diversion evaluation area, one additional soil type is present within El Estero Park, surrounding the lake:

*Narlon Loamy Fine Sand, 2-9% Slopes*. These soils are a gently to moderately sloping soil on dissected marine terraces. In a representative profile, the surface layer is a gray, medium acidic, loamy, fine sand about three inches thick. The subsurface layer is a white, mottled, slightly to medium acidic, loamy, fine sand approximately 10 inches thick. The subsoil is an approximately 40-inch thick light brownish gray to light gray, mottled, very strongly acidic clay. This soil is classified as hydric for Monterey County.

### 3.6.3. Hydrology

The following information was taken directly from the internal draft report *Groundwater Replenishment Project Urban Runoff Capture at Lake El Estero* prepared by Schaaf & Wheeler Consulting Civil Engineers (Schaaf & Wheeler) in April 2014:

Lake El Estero is an 18-acre lake located in the City of Monterey, less than one mile from the coast. It is fed by four tributary streams and a portion of the City's stormwater collection system. One tributary is a named stream (Majors Creek which runs through Dahvee Park), and the other three are unnamed streams. The Lake El Estero drainage basin is 2,418 acres, or approximately 3.78 square miles.

Lake El Estero was originally a brackish lagoon, connected by a surface stream to the Monterey Bay. The connection to the bay was changed to pipe culverts in the 1870s when the Monterey and Salinas Valley Railroad was constructed. Lake El Estero has been dredged several times during the last century to remove accumulated sediment. Until 1941, the drainage basin included 1,186-acres to the west, extending to Huckleberry Hill, which entered the Lake through a box culvert under Pearl Street. This portion of the City stormwater system was reconfigured with the addition of a box culvert under Figueroa Street, which now carries the flow from Pearl Street to discharge into the Monterey Bay at the Municipal Wharf. In 1968, the current stormwater pump station at the northeast corner of the lake and outfall pipeline were constructed to facilitate better management of water levels in the Lake El Estero.

## 3.7. Ditch

The Ditch is a highly degraded system that carries water primarily from urban and agricultural runoff, but also from tributaries that drain the northwestern slopes of the Gabilan Range. The Reclamation Ditch portion of the Ditch is a trapezoidal channel that was excavated between 1917 and 1920 to drain surface runoff, including several old lakes (Casagrande and Watson 2006). Within the urban areas of the City of Salinas, the Ditch has steep sides with numerous pipe culverts or bridges with lined inverts. The Tembladero Slough and Old Salinas River portions of the Ditch are natural features; however, they have also been highly manipulated and are similarly a trapezoidal channel with steep sides in most areas. Several portions of the Ditch have been armored with rip-rap to prevent erosion and vegetation has been removed to prevent flooding and minimize habitat for wildlife that may disturb the adjacent agricultural fields. The Ditch has been separated from the floodplain in all areas except for the stretch extending approximately 3,200 feet upstream of the tide gate at Potrero Road. A man-made wetland, designed for water treatment, abuts the Tembladero Slough and the Old Salinas River Channel, at the confluence of these waterways, and was included in the evaluation area (**Figure 1**). Within the Ditch evaluation area, 47 sampling points were taken. A portion of this evaluation area is located within the coastal zone.

### 3.7.1. Vegetation

The majority of the Ditch is surrounded by agricultural and urban areas, and consequently the vegetation within the evaluation area is highly degraded. The vegetation growing within the Ditch and along the banks is typically removed by use of herbicides, which enhances drainage flow and minimizes habitat for pest species adjacent to cropland (Casagrande and Watson 2006). Additionally, several areas of the Ditch are armored by rip-rap to prevent erosion, which also precludes the growth of much vegetation. In areas where the vegetation hasn't been removed, weedy species are typically dominant, such as watercress (*Nasturtium officinale*), saltbush (*Atriplex* sp.), bristly ox-tongue (*Picris echioides*), poison hemlock (*Conium maculatum*), black mustard (*Brassica nigra*), and wild radish (*Raphanus sativus*).

Although the majority of the Ditch is disturbed and degraded, some areas of native vegetation are still present. A few small areas of arroyo willow (*Salix lasiolepis*) are present along the Ditch. The floodplain adjacent to the lower reach of the Ditch, which extends from the tide gates at Potrero Road to approximately 3,200 feet upstream, is dominated by salt marsh. The floodplain extends from the bank of the channel to the toe of slope of the adjacent sand dunes and dune scrub habitat on the west side and to the toe of slope of the adjacent agricultural fields on the east side. The salt marsh is dominated by fleshy jaumea (*Jaumea carnosa*), alkali heath (*Frankenia salina*), gum-plant (*Grindelia stricta*), salt grass (*Distichlis spicata*), pacific silver-weed (*Potentilla anserina* ssp. *pacifica*), and pickleweed (*Salicornia pacifica*). Another area where significant native vegetation is present is at the man-made wetland where California bulrush (*Schoenoplectus californica*), alkali heath, fleshy jaumea, and salt grass are the dominant species. Native vegetation, consisting of species including Californiabulrush and fleshy jaumea, is also present along the Old Salinas River Channel upstream of the confluence with the Tembladero Slough.

### 3.7.2. Soils

The SSURGO Database (USDA-NRCS, 2003) identifies 16 map units within the Ditch evaluation area (**Figure 2**). The SSURGO Database description of these units is provided below with an indication of whether the soil is classified as hydric or not on the USDA NRCS *Hydric Soils of the United States* list (2014).

*Alviso Silty Clay Loam (Drained).* Please see soil description provided in Section 3.1.2 for Reclamation Ditch Diversion soils.

*Antioch Very Fine Sandy Loam, 0-2% Slopes and 2-9% Slopes.* These moderately well-drained soils, found on terraces and alluvial fans, were formed in alluvium derived from sedimentary rocks. In a representative profile, the surface layer is an approximately 15-inch thick, grayish-brown, strongly acid very fine sandy loam. The subsurface layer is an approximately six-inch thick, light gray, slightly acid, very fine sandy loam. These soils are not classified as hydric for Monterey County.

*Clear Lake Clay (Moderately Wet).* Please see soil description provided in Section 3.1.2 for Reclamation Ditch Diversion soils and Section 3.2.2 for Tembladero Slough soils.

*Cropley Silty Clay, 0-2% Slopes and 2-9% Slopes.* Please see soil description provided in Section 3.2.2 for Tembladero Slough soils. The soils on 0-2% slopes are classified as hydric for Monterey County; however, the soils on 2-9% slopes are not.

*Diablo Clay, 9-15% Slopes.* This well-drained soil is found in uplands and was formed in material underlain by calcareous sandstone and shale. In a representative profile, the surface layer is an approximately 30-inch thick, dark gray to very dark gray, slightly acidic, and neutral clay. This soil is not classified as hydric for Monterey County.

*Dune Land.* This soil is comprised of loose wind-deposited quartz and feldspar sand. It is found on gently sloping to steep areas of hummocks, mounds, and hills. This soil is classified as hydric for Monterey County.

*Elkhorn Fine Sandy Loam, 2-5% Slopes and 9-15% Slopes.* These well-drained soils are found on dune like marine terraces and on benches that have smooth, undulating slopes, and were formed in material underlain by weakly consolidated sandy sediments or ferruginous sandstone. In a representative profile, the top layer is an approximately 20- to 35-inch thick, gray or grayish brown, medium acid fine sandy loam. The soils on 2-5% slopes are classified as hydric for Monterey County; however, the soils on 9-15% slopes are not.

*Pacheco Clay Loam.* This poorly drained soil is found on nearly level floodplains and was formed in alluvium derived from sedimentary rocks. In a representative profile, the surface layer is an approximately 22-inch thick, dark gray, slightly acidic, and mildly alkaline clay loam. Pacheco clay loam is classified as hydric for Monterey County.

*Rincon Clay Loam, 2-9% Slopes.* This well-drained soil is found on alluvial fans and terraces, and was formed in alluvium derived from sandstone and shale. In a representative profile, the top layer is an approximately 14-inch thick, dark grayish brown, slightly acid clay loam. The surface layer can also consist of silty clay loam or sandy clay loam. The subsoil layer is an approximately 35-inch thick, dark grayish brown, brown, and light yellowish brown, neutral to moderately alkaline clay and heavy clay loam. This soil is not classified as hydric for Monterey County.

*Salinas Clay Loam, 0-2% Slopes.* Please see soil description provided in Section 3.3.2 for Blanco Drain soils.

*Santa Ynez Fine Sandy Loam, 9-15% Slopes.* This moderately well-drained soil is found on terraces and low hills, and was formed in alluvium derived from sandstone and granitic rock. In a representative profile, the top layer is an approximately 16- to 32-inch thick, grayish brown and gray, medium acid fine sandy loam. The subsurface layer is an approximately two-inch thick, light brownish gray, medium acid fine sandy loam. The subsoil layer is an approximately 25-inch thick, gray and grayish brown, medium acid to mildly alkaline clay and clay loam. This soil is not classified as hydric for Monterey County.

### 3.7.3. Hydrology

The Ditch is located in the Lower Salinas Valley Watershed and consists of the connected portions of the Reclamation Ditch, Tembladero Slough, and the Old Salinas River downstream of the Reclamation Ditch Diversion (approximately 12 miles total). The Reclamation Ditch is a drainage channel that flows westward from Carr Lake through the City of Salinas and the Salinas Valley and drains into Tembladero Slough, then the Old Salinas River Channel, and ultimately into Moss Landing Harbor through the tide gates at Potrero Road in Moss Landing. The tide gates are the downstream most control structure on the system. When the gates close during periods of high tide, water impounds behind the gates increasing the water surface elevations in the Old Salinas River Channel and the lower portion of the Tembladero Slough. When the tide gates open and water is allowed to flow into Elkhorn Slough the water surface elevation decreases. The effects of the tide and the tide gates dampen with distance from the gates. The majority of the water in the Ditch is from agricultural and urban runoff; however, some of the hydrology also originates from tributaries that drain the northwestern slopes of the Gabilan Range upstream of Carr Lake and Alisal Slough flows directly into the Ditch at the Tembladero Slough. Additionally, during the summer months, the Salinas River flows into the Old Salinas River Channel through a gated culvert at the Salinas Lagoon. Direct discharge from the Salinas River to the ocean is blocked by a seasonal sand bar which forms across the mouth of the Salinas Lagoon. During high winter flows in the Salinas River, the sand bar breaches and the river flows directly to the Bay. When the sand bar is breached, Monterey County Water Resources Agency (MCWRA) closes the slide gate to the Old Salinas River Channel.

A man-made wetland exists on the southern bank of the Tembladero Slough between the confluence of the Old Salinas River Channel and Molera Road. In this area, water is pumped from the Tembladero

Slough and deposited into the man-made wetland. The presence of wetland indicators at this location may be dependent upon the man-induced hydrology.

# 4. Results

## 4.1. Reclamation Ditch Diversion

### 4.1.1. Vegetation

No wetland vegetation was observed within the Reclamation Ditch Diversion evaluation area. The evaluation was approximately 50% denuded and the remaining 50% was covered by unidentifiable thatch.

### 4.1.2. Soils

No hydric soil indicators were present within the Reclamation Ditch Diversion evaluation area.

### 4.1.3. Hydrology

Hydrologic indicators were not observed at the sampling point (16) within the Reclamation Ditch evaluation area. However, approximately 115 feet of the Reclamation Ditch runs through this evaluation area. At this location, the Reclamation Ditch is approximately 15 to 17 feet wide (**Figure 4**).

## 4.2. Tembladero Slough Diversion

### 4.2.1. Vegetation

No wetland vegetation was observed within the Tembladero Slough Diversion evaluation area. The evaluation area was very sparsely vegetated spearscale and two other unidentifiable species.

### 4.2.2. Soils

No hydric soil indicators were present within the Tembladero Slough Diversion evaluation area.

### 4.2.3. Hydrology

The surface soil cracks hydrologic indicator was observed at one sampling point (9) within the Tembladero Slough evaluation area (**Figure 5**). Approximately 196 feet of the Tembladero Slough runs through this evaluation area. At this location, the Tembladero Slough is approximately 41 to 46 feet wide. Additionally approximately 50 feet of an agricultural drainage ditch connects with the Tembladero Slough within the evaluation area (**Figure 5**). At this location the drainage ditch is approximately 10 feet wide.

## 4.3. Blanco Drain Diversion

### 4.3.1. Vegetation

No wetland vegetation was observed within the Blanco Drain Diversion evaluation area. Although Arroyo willow (FAC) dominated the tree stratum at two of the sampling points, vegetation within the herb stratum was dominated by upland species and the sampling points did not pass the dominance test.

### 4.3.2. Soils

No hydric soil indicators were present within the Blanco Drain Diversion evaluation area.

### 4.3.3. Hydrology

Hydrologic indicators were observed at three sampling points within the Blanco Drain Diversion evaluation area. Riverine sediment deposits, riverine drift deposits, and drainage patterns were observed at sampling points 12 and 13, which were located just above OHW of the Salinas River main channel

(**Figure 6**). Additionally, although a sampling point was not taken below OHW; surface water was observed within the Salinas River main channel.

## 4.4. Locke Paddon Lake

### 4.4.1. Vegetation

Hydrophytic vegetation was observed at six sampling points within the Locke Paddon Lake evaluation area. Arroyo willow (FACW) dominated the tree stratum with an understory dominated by California blackberry (FAC), Santa Barbara sedge (*Carex barbarae* FACW), common rush (*Juncus effusus* OBL), and cattail (OBL).

### 4.4.2. Soils

Within the evaluation area the soils are completely sand, with the exception of the area at the southern end of the alignment. In this area, a woodchip fill has created sandy loam and loamy soils. The depleted matrix and sandy redox indicators were identified at three sampling points (37, 38, and 40) (**Figure 7**).

### 4.4.3. Hydrology

Within the evaluation area, indicators of wetland hydrology included saturation, presence of oxidized rhizospheres, and water-stained leaves. Additionally, presence of soil moisture (during the dry season) and topography were used as indicators of wetland hydrology at one sampling point (38) (**Figure 7**).

## 4.5. Roberts Lake

### 4.5.1. Vegetation

Hydrophytic vegetation was observed at six sampling points within the Roberts Lake evaluation area. Dominant species included Arroyo willow (FACW), bulrush (OBL), California blackberry (FAC), rabbitfoot grass (FACW), and Pacific silver-weed (OBL).

### 4.5.2. Soils

Within the evaluation area soils were either a sandy loam or a sandy silt fill with rock. The depleted matrix indicator was exhibited at four sampling points (48, 50, 52, and 53) and the gleyed matrix was exhibited at two sampling points (44 and 46) (**Figure 8**).

### 4.5.3. Hydrology

Within the evaluation area, hydrologic indicators included saturation at two sampling points (44 and 46) and a high water table at one point (44) (**Figure 8**). Additionally, presence of soil moisture (during the dry season) and topography were used as indicators of wetland hydrology for four sampling points (48, 50, 52, and 53).

## 4.6. Lake El Estero Diversion

### 4.6.1. Vegetation

No vegetation is present within the Lake El Estero Diversion evaluation area. Outside of the evaluation area within the lake, small areas of bulrush (OBL) are present at the edge of the lake. The remainder of vegetation at El Estero Park is dominated by turf and landscaping.

### 4.6.2. Soils

A soil pit was not dug within the Lake El Estero Diversion evaluation area, as the substrate is a cement pad.

### 4.6.3. Hydrology

The Lake El Estero Diversion evaluation area is located in the upland adjacent to Lake El Estero. No hydrologic indicators are present within the evaluation area. Surface water within the lake is visible on aerials, which was utilized to identify hydrology adjacent to the evaluation area (**Figure 9**).

## 4.7. Ditch

### 4.7.1. Vegetation

Vegetation within most of the Ditch evaluation area is significantly disturbed. As such, this delineation focused primarily on areas where potential wetland vegetation was present. Wetland vegetation was observed at 47 sampling points within the Ditch evaluation area. Sampling points 20, 23, 32, and 34 are located near where roads pass over the Ditch (**Figures 10a and 10b**). At these sampling points wetland vegetation consisted of a mix of native species, such as watercress (OBL), swamp knotweed (*Polygonum amphibium* var. *emersum* OBL), willow-herb (*Epilobium ciliatum* FACW), and salt heliotrope (*Heliotropium curassavicum* OBL); and non-native species, such as curly dock (*Rumex crispus* FACW), rabbitfoot grass (FACW), and poison hemlock (FACW). Sampling point 30 located just west of Highway 183, and sampling point 31 located just west of Boronda Road, are dominated by Arroyo willow (FAC) (**Figures 10a and 10b**). Sampling points 24, 25, 60, and 68-72 are located within the man-made wetland near Molera Road (**Figure 10a**). Dominant species present in the man-made wetland include alkali heath (OBL), fleshy jaumea (OBL), salt grass (FAC), and California bulrush (OBL). Sampling points 3, 4, 5, 8, 27, and 28 are located within the salt marsh area just upstream of the tide gates at Potrero Road (**Figure 10a**). Dominant species within the salt marsh included fleshy jaumea (OBL), alkali heath (OBL), gum-plant (FACW), salt grass (FAC), pacific silver-weed (OBL), and pickleweed (OBL). Sampling points 54-60 are located along the Old Salinas River Channel, upstream of the confluence with Tembladero Slough (**Figure 10a)**. At these sampling points dominant species present included bulrush (OBL), pacific silver-weed (OBL), mule fat (*Baccharis salicifolia* FAC), fleshy jaumea (OBL), and spearscale (FAC). The remaining sampling points taken at the Ditch were either unvegetated (five points) or dominated by non-native upland species (eight points) or coastal dune scrub species (two points).

### 4.7.2. Soils

Hydric soil indicators were observed at 17 sampling points within the Ditch evaluation area. Indicators observed included loamy gleyed matrix (points 3, 8, 33, 35, 61, and 72), sandy redox (point 4), 1 cm muck (point 5), depleted matrix (points 5, 34, 55, 64, 68, and 69), of redox dark surface (points 21 and 25), and depleted dark surface (point 28) (**Figures 10a and 10b**).

### 4.7.3. Hydrology

Hydrologic indicators were observed at 25 of the sampling points within the Ditch evaluation area. Primary indicators were observed at 12 sampling points (5, 25, 33, 35, 55, 57, 58, 59, 61-64, 67-69, 72) (**Figures 10a**). The primary indicators observed included surface water, high water table, saturation, oxidized rhizospheres along living roots, presence of reduced iron, and soil surface cracks. Two or more secondary indicators were observed at eight sampling points (3, 4, 8, 18, 20, 21, 23, 28, 57-59, and 65) (**Figures 10a and 10b**). The secondary indicators observe included riverine water marks, riverine drift deposits, and drainage patterns.

# 5. Jurisdiction

Sections within each evaluation area were identified as having the potential to support wetlands and/or other waters. Approximately 51.94 acres of other waters of the U.S. and 15.28 acres of federal wetlands potentially under the jurisdiction of the ACOE were identified within the evaluation areas. Of the federal wetlands potentially under the jurisdiction of the ACOE approximately 14.68 acres are located in the coastal zone and may also be under the jurisdiction of the CCC. Approximately 4.84 additional acres of potential coastal wetlands under the jurisdiction of the CCC were also identified.

## 5.1. Federal Jurisdiction

### 5.1.1. Reclamation Ditch Diversion

Approximately 0.05 acre of potential other waters of the U.S. were identified within the Reclamation Ditch Diversion evaluation area (**Figure 4**; **Appendix A**). No potentially federal wetlands were identified in this evaluation area.

### 5.1.2. Tembladero Slough Diversion

Approximately 0.20 acre of potential other waters of the U.S. were identified within the Tembladero Slough Diversion evaluation area (**Figure 5**; **Appendix A**). No potentially federal wetlands were identified in this evaluation area.

### 5.1.3. Blanco Drain Diversion

Approximately 0.12 acre of the agricultural drainage ditch and approximately 0.18 acre of the main channel of the Salinas River were identified as potential other waters of the U.S. within the Blanco Drain Diversion evaluation area (**Figure 6**; **Appendix A**). No potentially federal wetlands were identified in this evaluation area.

### 5.1.4. Locke Paddon Lake

Within the Locke Paddon Lake evaluation area, approximately 0.26 acre of federal wetlands potentially under ACOE jurisdiction was identified (**Figure 7**; **Appendix A**). Please note that the wetlands at Locke Paddon Lake extend beyond the evaluation area; however, due to access issues only the area within the GWR Project site were evaluated. No potential other waters of the U.S. were identified within the evaluation area.

### 5.1.5. Roberts Lake

Within the Roberts Lake evaluation area, approximately 0.55 acre of potential federal wetlands and 0.25 acre of potential other waters were identified (**Figure 8**; **Appendix A**). Please note that the wetlands at Roberts Lake extend beyond the evaluation area; however, due to access issues only the area within the GWR Project site was evaluated.

### 5.1.6. Lake El Estero Diversion

No potentially federal wetlands or other waters of the U.S. are present within the Lake El Estero Diversion evaluation area (**Figure 9**; **Appendix A**). Approximately 0.69 acre of potentially federal wetland and 17.27 acre of potential other waters are present within Lake El Estero; however, these areas will not be impacted by construction of water diversion as a result of the GWR Project.

#### 5.1.7. Ditch

Approximately 14.41 acres of federal wetlands potentially under the jurisdiction of the ACOE were identified within the Ditch evaluation area (**Figures 10a and 10b**; **Appendix A**). Additionally, approximately 51.15 acres of other waters were identified within this evaluation area.

### 5.2. CCC Jurisdiction

#### 5.2.1. Reclamation Ditch Diversion

The Reclamation Ditch Diversion evaluation area is not located in the coastal zone. As such, no potential coastal wetlands are present within this area.

#### 5.2.2. Tembladero Slough Diversion

Approximately 0.01 acre of wetlands potentially under the jurisdiction of the CCC was identified within the Tembladero Slough Diversion evaluation are (**Figure 5**; **Appendix A**).

#### 5.2.3. Blanco Drain Diversion

The Blanco Drain Diversion evaluation area is not located in the coastal zone. As such, no potential coastal wetlands are present within this area.

#### 5.2.4. Locke Paddon Lake

Approximately 0.57 acre of wetlands potentially under the jurisdiction of the CCC was identified within the Locke Paddon Lake evaluation area (**Figure 7**; **Appendix A**). This number includes potentially federally jurisdictional wetlands and additional areas that met only one or two parameters. Please note that the wetlands at Locke Paddon Lake extend beyond the evaluation area; however, due to access issues only the area within the GWR Project site were evaluated.

#### 5.2.5. Roberts Lake

Approximately 0.57 acre of wetlands potentially under the jurisdiction of the CCC was identified within the Roberts Lake evaluation area (**Figure 8**; **Appendix A**). This number includes potentially federally jurisdictional wetlands and additional areas that met only one or two parameters.

#### 5.2.6. Lake El Estero Diversion

The Lake El Estero Diversion evaluation area is not located in the coastal zone. As such, no potential coastal wetlands are present within this area.

#### 5.2.7. Ditch

Approximately 18.37 acres of wetlands potentially under the jurisdiction of the CCC were identified within the Ditch evaluation area (**Figures 10a and 10b**; **Appendix A**). This number includes 13.88 acres of potentially federally jurisdictional wetlands and 4.5 acres of additional areas that met only one or two parameters.

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Ground Water Replenishment (GWR) City/County: Moss Landing / Monterey Sampling Date: 7-24-14

Applicant/Owner: MRWPCA State: CA Sampling Point: [illegible]

Investigator(s): [illegible] Section, Township, Range: N/A

Landform (hillslope, terrace, etc.): [illegible] Local relief (concave, convex, none): [illegible] Slope (%): [illegible]

Subregion (LRR): LRRC Lat: 36°47'25.69"N Long: 121°47'28.09"W Datum: NAD83

Soil Map Unit Name: [illegible] NWI classification: Estuarine [illegible]

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes ____ | No X |
| Hydric Soil Present? | Yes ____ | No X |
| Wetland Hydrology Present? | Yes X | No ____ |

Is the Sampled Area within a Wetland? Yes ____ No X

Remarks:
[illegible]

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: ____) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| | | = Total Cover | |
| **Sapling/Shrub Stratum** (Plot size: ____) | | | |

Depth (inches): ________

**Hydric Soil Present?** Yes ____ No ✓

Remarks:

Large rip rap

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- X Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- X Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ____ No X Depth (inches): ________

Water Table Present? Yes ____ No X Depth (inches): ________

Saturation Present? (includes capillary fringe) Yes ____ No X Depth (inches): ________

**Wetland Hydrology Present?** Yes ____ No ✓

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: GWR City/County: Salinas/ Monterey Co Sampling Date: 8-5-14

Applicant/Owner: MRWPCA State: CA Sampling Point: 19

Investigator(s): [illegible] Section, Township, Range: ____

Landform (hillslope, terrace, etc.): top of bank Local relief (concave, convex, none): Concave Slope (%): 20%

Subregion (LRR): LRR C Lat: 36°42'17.88"N Long: 121°42'18.82"W Datum: NAD83

Soil Map Unit Name: CLEAR LAKE CLAY, MODERATELY WET NWI classification: N/A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes Y No ____

Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes ____ No X | Is the Sampled Area within a Wetland? Yes ____ No X |
| Hydric Soil Present? | Yes ____ No X | |
| Wetland Hydrology Present? | Yes ____ No X | |

Remarks:

### VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: ____) | Absolute % Cover | Dominant Species? | Indicator Status |

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- __ Surface Water (A1)
- __ High Water Table (A2)
- __ Saturation (A3)
- __ Water Marks (B1) (**Nonriverine**)
- __ Sediment Deposits (B2) (**Nonriverine**)
- __ Drift Deposits (B3) (**Nonriverine**)
- __ Surface Soil Cracks (B6)
- __ Inundation Visible on Aerial Imagery (B7)
- __ Water-Stained Leaves (B9)
- __ Salt Crust (B11)
- __ Biotic Crust (B12)
- __ Aquatic Invertebrates (B13)
- __ Hydrogen Sulfide Odor (C1)
- __ Oxidized Rhizospheres along Living Roots (C3)
- __ Presence of Reduced Iron (C4)
- __ Recent Iron Reduction in Tilled Soils (C6)
- __ Thin Muck Surface (C7)
- __ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- __ Water Marks (B1) (**Riverine**)
- __ Sediment Deposits (B2) (**Riverine**)
- __ Drift Deposits (B3) (**Riverine**)
- __ Drainage Patterns (B10)
- __ Dry-Season Water Table (C2)
- __ Crayfish Burrows (C8)
- __ Saturation Visible on Aerial Imagery (C9)
- __ Shallow Aquitard (D3)
- __ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ____ No ✓ Depth (inches): ______

Water Table Present? Yes ____ No ✓ Depth (inches): ______

Saturation Present? (includes capillary fringe) Yes ____ No ✓ Depth (inches): ______

**Wetland Hydrology Present?** **Yes** ____ **No** ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

edge of ag field

# WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: GWR City/County: Salinas / Monterey Co Sampling Date: 8-5-14

Applicant/Owner: MRWPCA State: CA Sampling Point: 20

Investigator(s): [illegible] Section, Township, Range: ______

Landform (hillslope, terrace, etc.): top of slope Local relief (concave, convex, none): Cocave Slope (%): 1

Subregion (LRR): LRR C Lat: 36° 42' 18.70"N Long: 121° 42' 18.56"W Datum: NAD83

Soil Map Unit Name: Clear Lake Clay, moderately wet NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation N, Soil Y, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No ____ | Is the Sampled Area within a Wetland? Yes ____ No X |
| Hydric Soil Present? | Yes ____ No X | |
| Wetland Hydrology Present? | Yes X No ____ | |

Remarks: This point could be considered a wetland if soils were [illegible] due to sampling [illegible] however the type of environment is so [illegible] in the Rec Ditch that [illegible] it seems [illegible]. Better option is to lump in with waters

## VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: ____) | Absolute % Cover | Dominant Species? | Indicator Status |

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ___ No X Depth (inches): ___

Water Table Present? Yes ___ No X Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): ___

**Wetland Hydrology Present?** Yes ___ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Monterey Peninsula Fixed Guideway City/County: Castroville/Monterey Sampling Date: 10-19-09

Applicant/Owner: TAMC State: CA Sampling Point: 10 [illegible]

Investigator(s): JD&JH Section, Township, Range: ____

Landform (hillslope, terrace, etc.): ____ Local relief (concave, convex, none): concave Slope (%): ____

Subregion (LRR): LRR C Lat: ____ Long: ____ Datum: ____

Soil Map Unit Name: Pacheco Clay Loam NWI classification: ____

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No ____ (If no, explain in Remarks.)

Are Vegetation Y, Soil Y, or Hydrology Y significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No ____ | Is the Sampled Area within a Wetland? Yes ____ No X |
| Hydric Soil Present? | Yes X No ____ | |
| Wetland Hydrology Present? | Yes ____ No X | |

Remarks:
disturbed by maintaining [illegible] channel - near ag. fields

### VEGETATION

| Tree Stratum (Use scientific names.) | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. None | | | |
| 2. | | | |

| 1. | | | |
| 2. | | | |
| Total Cover: | | | |

% Bare Ground in Herb Stratum 20 % Cover of Biotic Crust ____

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100% (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | | Multiply by: |
|---|---|---|
| OBL species | ____ | x 1 = ____ |
| FACW species | ____ | x 2 = ____ |
| FAC species | ____ | x 3 = ____ |
| FACU species | ____ | x 4 = ____ |
| UPL species | ____ | x 5 = ____ |
| Column Totals: | ____ (A) | ____ (B) |

Prevalence Index = B/A = ____

**Hydrophytic Vegetation Indicators:**

- ___ Dominance Test is >50%
- ___ Prevalence Index is ≤3.0[1]
- ___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- ___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present.

**Hydrophytic Vegetation Present?** Yes X No ____

Remarks:
Next to open water

## SOIL

Sampling Point: 10

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-20 | 10YR 3/1 | | | | | | Silt | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [2]Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- __ Histosol (A1)
- __ Histic Epipedon (A2)
- __ Black Histic (A3)
- __ Hydrogen Sulfide (A4)
- __ Stratified Layers (A5) (**LRR C**)
- __ 1 cm Muck (A9) (**LRR D**)
- __ Depleted Below Dark Surface (A11)
- __ Thick Dark Surface (A12)
- __ Sandy Mucky Mineral (S1)
- __ Sandy Gleyed Matrix (S4)
- __ Sandy Redox (S5)
- __ Stripped Matrix (S6)
- __ Loamy Mucky Mineral (F1)
- __ Loamy Gleyed Matrix (F2)
- X Depleted Matrix (F3)
- __ Redox Dark Surface (F6)
- __ Depleted Dark Surface (F7)
- __ Redox Depressions (F8)
- __ Vernal Pools (F9)

**Indicators for Problematic Hydric Soils[3]:**

- __ 1 cm Muck (A9) (**LRR C**)
- __ 2 cm Muck (A10) (**LRR B**)
- __ Reduced Vertic (F18)
- __ Red Parent Material (TF2)
- __ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present.

**Restrictive Layer (if present):**
Type: ____
Depth (inches): ____

**Hydric Soil Present?** Yes X No ____

Remarks:
soil disturbed - not a native soil in its native condition - soil turned many times

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (any one indicator is sufficient)

- __ Surface Water (A1)
- __ High Water Table (A2)
- __ Saturation (A3)
- __ Water Marks (B1) (**Nonriverine**)
- __ Sediment Deposits (B2) (**Nonriverine**)
- __ Drift Deposits (B3) (**Nonriverine**)
- __ Surface Soil Cracks (B6)
- __ Inundation Visible on Aerial Imagery (B7)
- __ Water-Stained Leaves (B9)
- __ Salt Crust (B11)
- __ Biotic Crust (B12)
- __ Aquatic Invertebrates (B13)
- __ Hydrogen Sulfide Odor (C1)
- __ Oxidized Rhizospheres along Living Roots (C3)
- __ Presence of Reduced Iron (C4)
- __ Recent Iron Reduction in Plowed Soils (C6)
- __ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- __ Water Marks (B1) (**Riverine**)
- __ Sediment Deposits (B2) (**Riverine**)
- __ Drift Deposits (B3) (**Riverine**)
- __ Drainage Patterns (B10)
- __ Dry-Season Water Table (C2)
- __ Thin Muck Surface (C7)
- __ Crayfish Burrows (C8)
- __ Saturation Visible on Aerial Imagery (C9)
- __ Shallow Aquitard (D3)
- __ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ____ No X Depth (inches): ____
Water Table Present? Yes ____ No X Depth (inches): ____
Saturation Present? (includes capillary fringe) Yes ____ No X Depth (inches): ____

**Wetland Hydrology Present?** Yes ____ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (any one indicator is sufficient)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (Nonriverine)
- ___ Sediment Deposits (B2) (Nonriverine)
- ___ Drift Deposits (B3) (Nonriverine)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Plowed Soils (C6)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (Riverine)
- ___ Sediment Deposits (B2) (Riverine)
- ___ Drift Deposits (B3) (Riverine)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Thin Muck Surface (C7)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ____ No X Depth (inches): ____

Water Table Present? Yes ____ No X Depth (inches): ____

Saturation Present? (includes capillary fringe) Yes ____ No X Depth (inches): ____

**Wetland Hydrology Present?** Yes ____ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (any one indicator is sufficient)

__ Surface Water (A1)
__ High Water Table (A2)
__ Saturation (A3)
__ Water Marks (B1) (Nonriverine)
__ Sediment Deposits (B2) (Nonriverine)
__ Drift Deposits (B3) (Nonriverine)
__ Surface Soil Cracks (B6)
__ Inundation Visible on Aerial Imagery (B7)
__ Water-Stained Leaves (B9)
__ Salt Crust (B11)
__ Biotic Crust (B12)
__ Aquatic Invertebrates (B13)
__ Hydrogen Sulfide Odor (C1)
__ Oxidized Rhizospheres along Living Roots (C3)
__ Presence of Reduced Iron (C4)
__ Recent Iron Reduction in Plowed Soils (C6)
__ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

__ Water Marks (B1) (Riverine)
__ Sediment Deposits (B2) (Riverine)
__ Drift Deposits (B3) (Riverine)
__ Drainage Patterns (B10)
__ Dry-Season Water Table (C2)
__ Thin Muck Surface (C7)
__ Crayfish Burrows (C8)
__ Saturation Visible on Aerial Imagery (C9)
__ Shallow Aquitard (D3)
__ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ____ No X Depth (inches): ______

Water Table Present? Yes ____ No X Depth (inches): ______

Saturation Present? (includes capillary fringe) Yes ____ No X Depth (inches): ______

**Wetland Hydrology Present?** Yes ____ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (any one indicator is sufficient)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (Nonriverine)
- ___ Sediment Deposits (B2) (Nonriverine)
- ___ Drift Deposits (B3) (Nonriverine)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Plowed Soils (C6)
- X Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (Riverine)
- ___ Sediment Deposits (B2) (Riverine)
- ___ Drift Deposits (B3) (Riverine)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Thin Muck Surface (C7)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes ___ No X Depth (inches): ______

Water Table Present? Yes ___ No X Depth (inches): ______

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): ______

**Wetland Hydrology Present?** Yes X No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

moist but not saturated - low point - moist during dry season

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: GWR (Old Salinas River) City/County: Monterey Sampling Date: 2-10-15

Applicant/Owner: MRWPCA State: CA Sampling Point: K54

Investigator(s): M. Johnson, S. Hession Section, Township, Range: ______

Landform (hillslope, terrace, etc.): Bank Local relief (concave, convex, none): none Slope (%): 0

Subregion (LRR): Arid West (LRR C) Lat: ______ Long: ______ Datum: NAD83

Soil Map Unit Name: Alviso NWI classification: FEW

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No ____ | Is the Sampled Area within a Wetland? Yes ____ No X |
| Hydric Soil Present? | Yes ____ No X | |
| Wetland Hydrology Present? | Yes ____ No X | |

Remarks: 3rd year of drought conditions, statewide.

### VEGETATION – Use scientific names of plants.

| | Absolute % Cover | Dominant Species? | Indicator Status |

Soil Map Unit Name: Pacheco NWI classification: ____
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)
Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____
Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

| | | |
|---|---|---|
| Hydrophytic Vegetation Present? | Yes X No ____ | Is the Sampled Area within a Wetland? Yes X No ____ |
| Hydric Soil Present? | Yes X No ____ | |
| Wetland Hydrology Present? | Yes X No ____ | |

Remarks: 3rd year of state wide drought

## VEGETATION – Use scientific names of plants.

| Tree Stratum (Plot size: 10'X10') | Absolute % Cover | Dominant Species? | Indicator Status |
|---|---|---|---|
| 1. Salix lasiolepis | 20 | Y | FACW |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| | 20 | = Total Cover | |
| **Sapling/Shrub Stratum** (Plot size: ____) | | | |
| 1. | | | |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| 5. | | | |
| | | = Total Cover | |
| **Herb Stratum** (Plot size: 5'x5') | | | |
| 1. Conium maculatum | 70 | Y | FACW |
| 2. | | | |
| 3. | | | |
| 4. | | | |
| 5. | | | |
| 6. | | | |
| 7. | | | |
| 8. | | | |
| | 70 | = Total Cover | |
| **Woody Vine Stratum** (Plot size: ____) | | | |
| 1. | | | |
| 2. | | | |
| | | = Total Cover | |

% Bare Ground in Herb Stratum ____ % Cover of Biotic Crust ____

**Dominance Test worksheet:**

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**

| Total % Cover of: | | Multiply by: |
|---|---|---|
| OBL species | ____ | x 1 = ____ |
| FACW species | ____ | x 2 = ____ |
| FAC species | ____ | x 3 = ____ |
| FACU species | ____ | x 4 = ____ |
| UPL species | ____ | x 5 = ____ |
| Column Totals: | ____ (A) | ____ (B) |

Prevalence Index = B/A = ____

**Hydrophytic Vegetation Indicators:**

X Dominance Test is >50%
__ Prevalence Index is ≤3.0[1]
__ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
__ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No ____

Remarks:

## SOIL

Sampling Point: 6-1

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

| Depth (inches) | Matrix Color (moist) | Matrix % | Redox Features Color (moist) | Redox Features % | Type[1] | Loc[2] | Texture | Remarks |
|---|---|---|---|---|---|---|---|---|
| 0-2 | 10YR3/1 | 100 | | | | | | Muck |
| 2-18 | Gley 1 4/N | 100 | | | | | Clay | Gley |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

**Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)**

- __ Histosol (A1)
- __ Histic Epipedon (A2)
- __ Black Histic (A3)
- __ Hydrogen Sulfide (A4)
- __ Stratified Layers (A5) (**LRR C**)
- X 1 cm Muck (A9) (**LRR D**)
- __ Depleted Below Dark Surface (A11)
- __ Thick Dark Surface (A12)
- __ Sandy Mucky Mineral (S1)
- __ Sandy Gleyed Matrix (S4)
- __ Sandy Redox (S5)
- __ Stripped Matrix (S6)
- __ Loamy Mucky Mineral (F1)
- X Loamy Gleyed Matrix (F2)
- __ Depleted Matrix (F3)
- __ Redox Dark Surface (F6)
- __ Depleted Dark Surface (F7)
- __ Redox Depressions (F8)
- __ Vernal Pools (F9)

**Indicators for Problematic Hydric Soils[3]:**

- __ 1 cm Muck (A9) (**LRR C**)
- __ 2 cm Muck (A10) (**LRR B**)
- __ Reduced Vertic (F18)
- __ Red Parent Material (TF2)
- __ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

**Restrictive Layer (if present):**

Type: ____________

Depth (inches): ____________

**Hydric Soil Present?** Yes X No ____

Remarks:

## HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one required; check all that apply)

- X Surface Water (A1)
- X High Water Table (A2)
- X Saturation (A3)
- __ Water Marks (B1) (**Nonriverine**)
- __ Sediment Deposits (B2) (**Nonriverine**)
- __ Drift Deposits (B3) (**Nonriverine**)
- __ Surface Soil Cracks (B6)
- __ Inundation Visible on Aerial Imagery (B7)
- __ Water-Stained Leaves (B9)
- __ Salt Crust (B11)
- __ Biotic Crust (B12)
- __ Aquatic Invertebrates (B13)
- __ Hydrogen Sulfide Odor (C1)
- __ Oxidized Rhizospheres along Living Roots (C3)
- __ Presence of Reduced Iron (C4)
- __ Recent Iron Reduction in Tilled Soils (C6)
- __ Thin Muck Surface (C7)
- __ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- __ Water Marks (B1) (**Riverine**)
- __ Sediment Deposits (B2) (**Riverine**)
- __ Drift Deposits (B3) (**Riverine**)
- __ Drainage Patterns (B10)
- __ Dry-Season Water Table (C2)
- __ Crayfish Burrows (C8)
- __ Saturation Visible on Aerial Imagery (C9)
- __ Shallow Aquitard (D3)
- __ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present? Yes X No ____ Depth (inches): 0

Water Table Present? Yes X No ____ Depth (inches): 0

Saturation Present? (includes capillary fringe) Yes X No ____ Depth (inches): 0

**Wetland Hydrology Present?** Yes X No ____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: GWR Rec Ditch City/County: Monterey Sampling Date: 2.12.15
Applicant/Owner: MRWPCA State: CA Sampling Point: 2 102
Investigator(s): M. Johnson Section, Township, Range: ______
Landform (hillslope, terrace, etc.): Flood plain Local relief (concave, convex, none): Concave Slope (%): 2
Subregion (LRR): Arid West (LRRC) Lat: ______ Long: ______ Datum: NAD83
Soil Map Unit Name: Pacheco NWI classification: ______
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ___ No X (If no, explain in Remarks.)
Are Vegetation ___, Soil ___, or Hydrology ___ significantly disturbed? Are "Normal Circumstances" present? Yes X No ___
Are Vegetation ___, Soil ___, or Hydrology ___ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**
